Africa Leapfrogs Developed Markets –

An inability to build new capacity in the developed world due to increasing environmental regulations creates a new flexible and localized manufacturing process. This process churns out the highly customized products consumers demand at an ever-faster pace. With less of an installed asset base and the ability to better leverage its natural resources, Africa jumps ahead of the developed world in growth and economic dynamism.

Drivers:

- Simulation
- Resource Constraints

System Dynamics

- Developed World New Manufacturing Model
- Hyper-competitive Churn
- Africa Leapfrogs the Developed World

Scenario Values

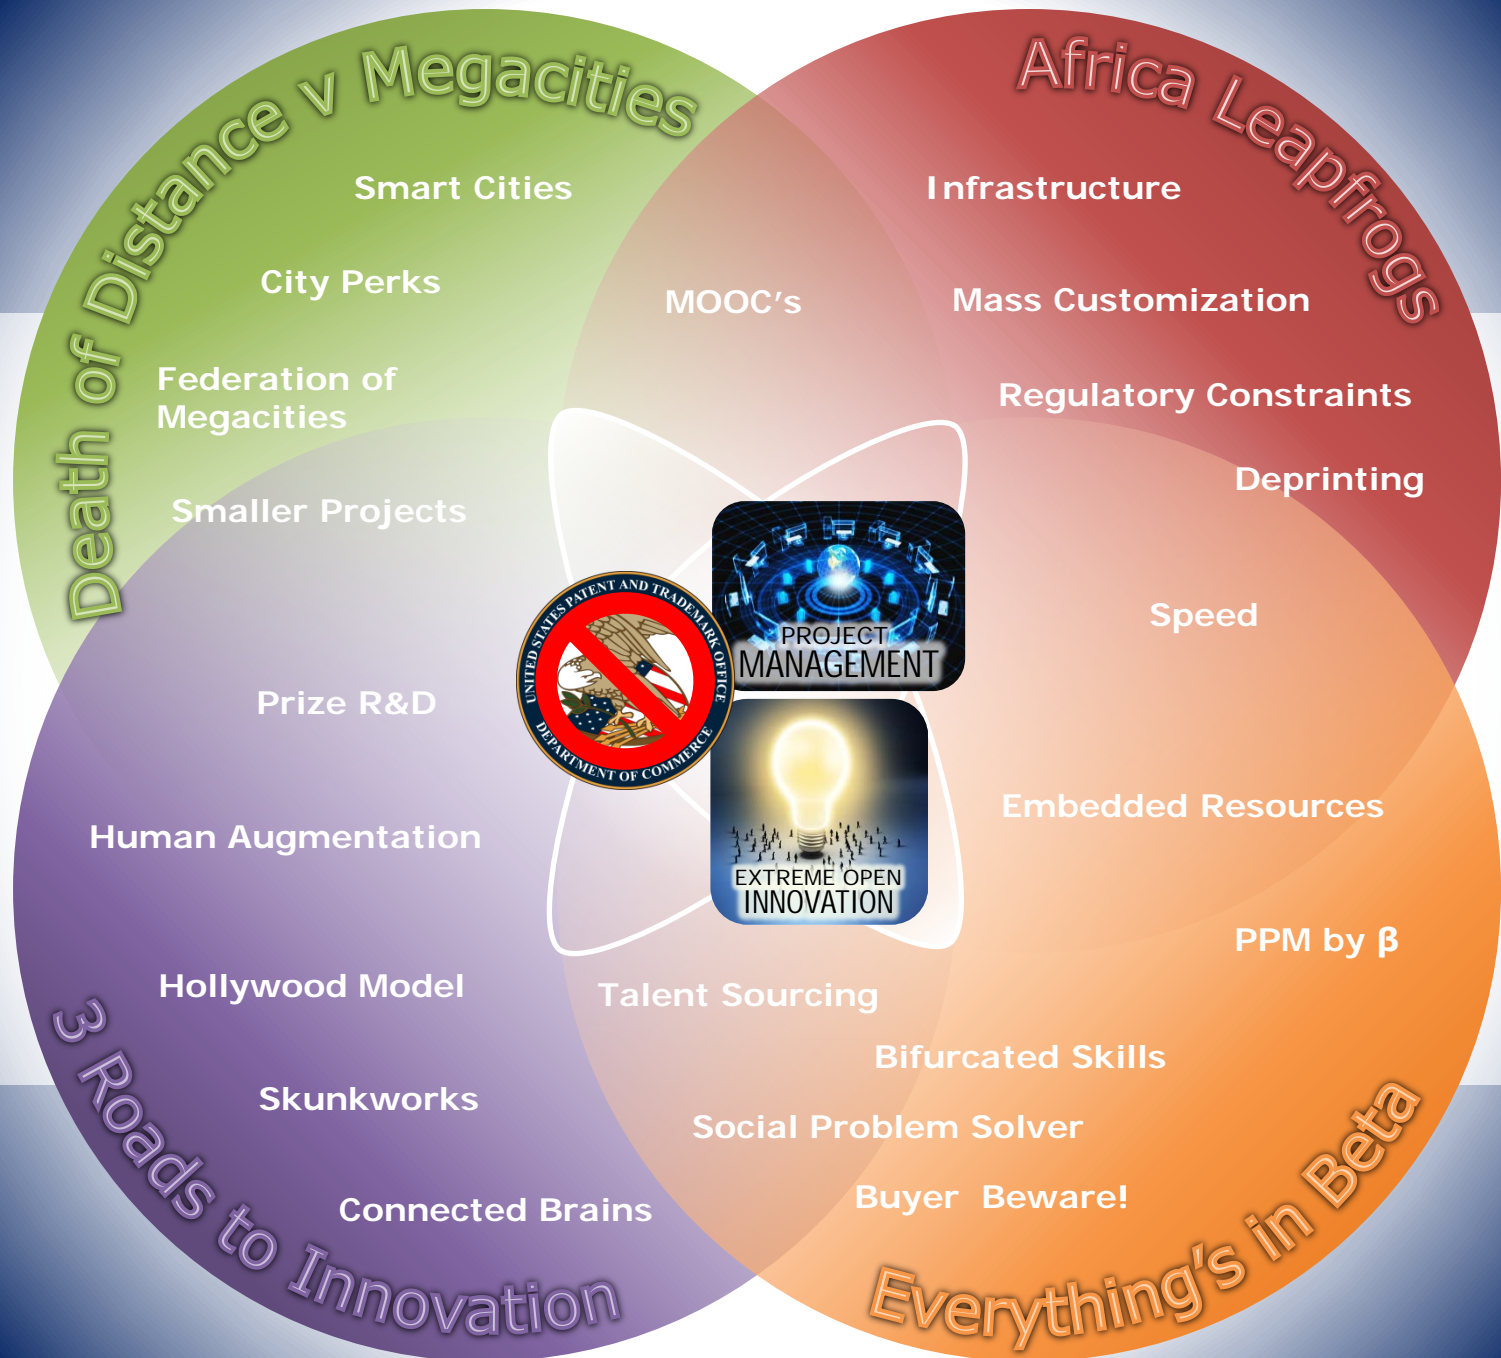

- Cut throat capitalism in the "new New World"
- Transformative power of younger innovators
- Integrative power of older innovators
- Market speed
- Consumer demand

Scenario Analysis

The values of this culture in 2038 are not much different than today. Aside from strict environmental regulation in the developed countries, the world is still driven by consumer demand and consumption. This scenario is characterized by incredible market speed, fueled by hyper-competition in a shrinking market and cut throat capitalism from Africa.

The youthful energy of Africa, unharnessed by almost free world-class education and rapidly expanding economy, develops transformational innovations characteristic of young inventors and entrepreneurs. This is tempered by the developed world's older scientists and engineers, who excel at integrating this future's mix of Big Data, distributed manufacturing, and limited resources.

Throughout this churn there is little room for the middle class. With much lower requirements for people, owners and private shareholders of small companies can compete with any company worldwide. Society bifurcates between owners of companies and natural resources creating value and the service workers that support them.
