4. Solid

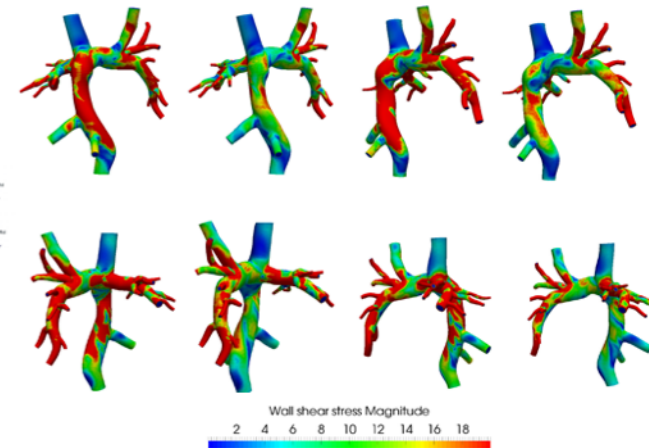

5. Mesh

6. Boundary Conditions

7. Simulation

Motivation for Cardiovascular Modeling

Virtual surgery and treatment planning

Fundamental disease mechanisms

Patient risk stratification

Personalized Medicine

Test novel surgical concepts

Augmenting clinical imaging

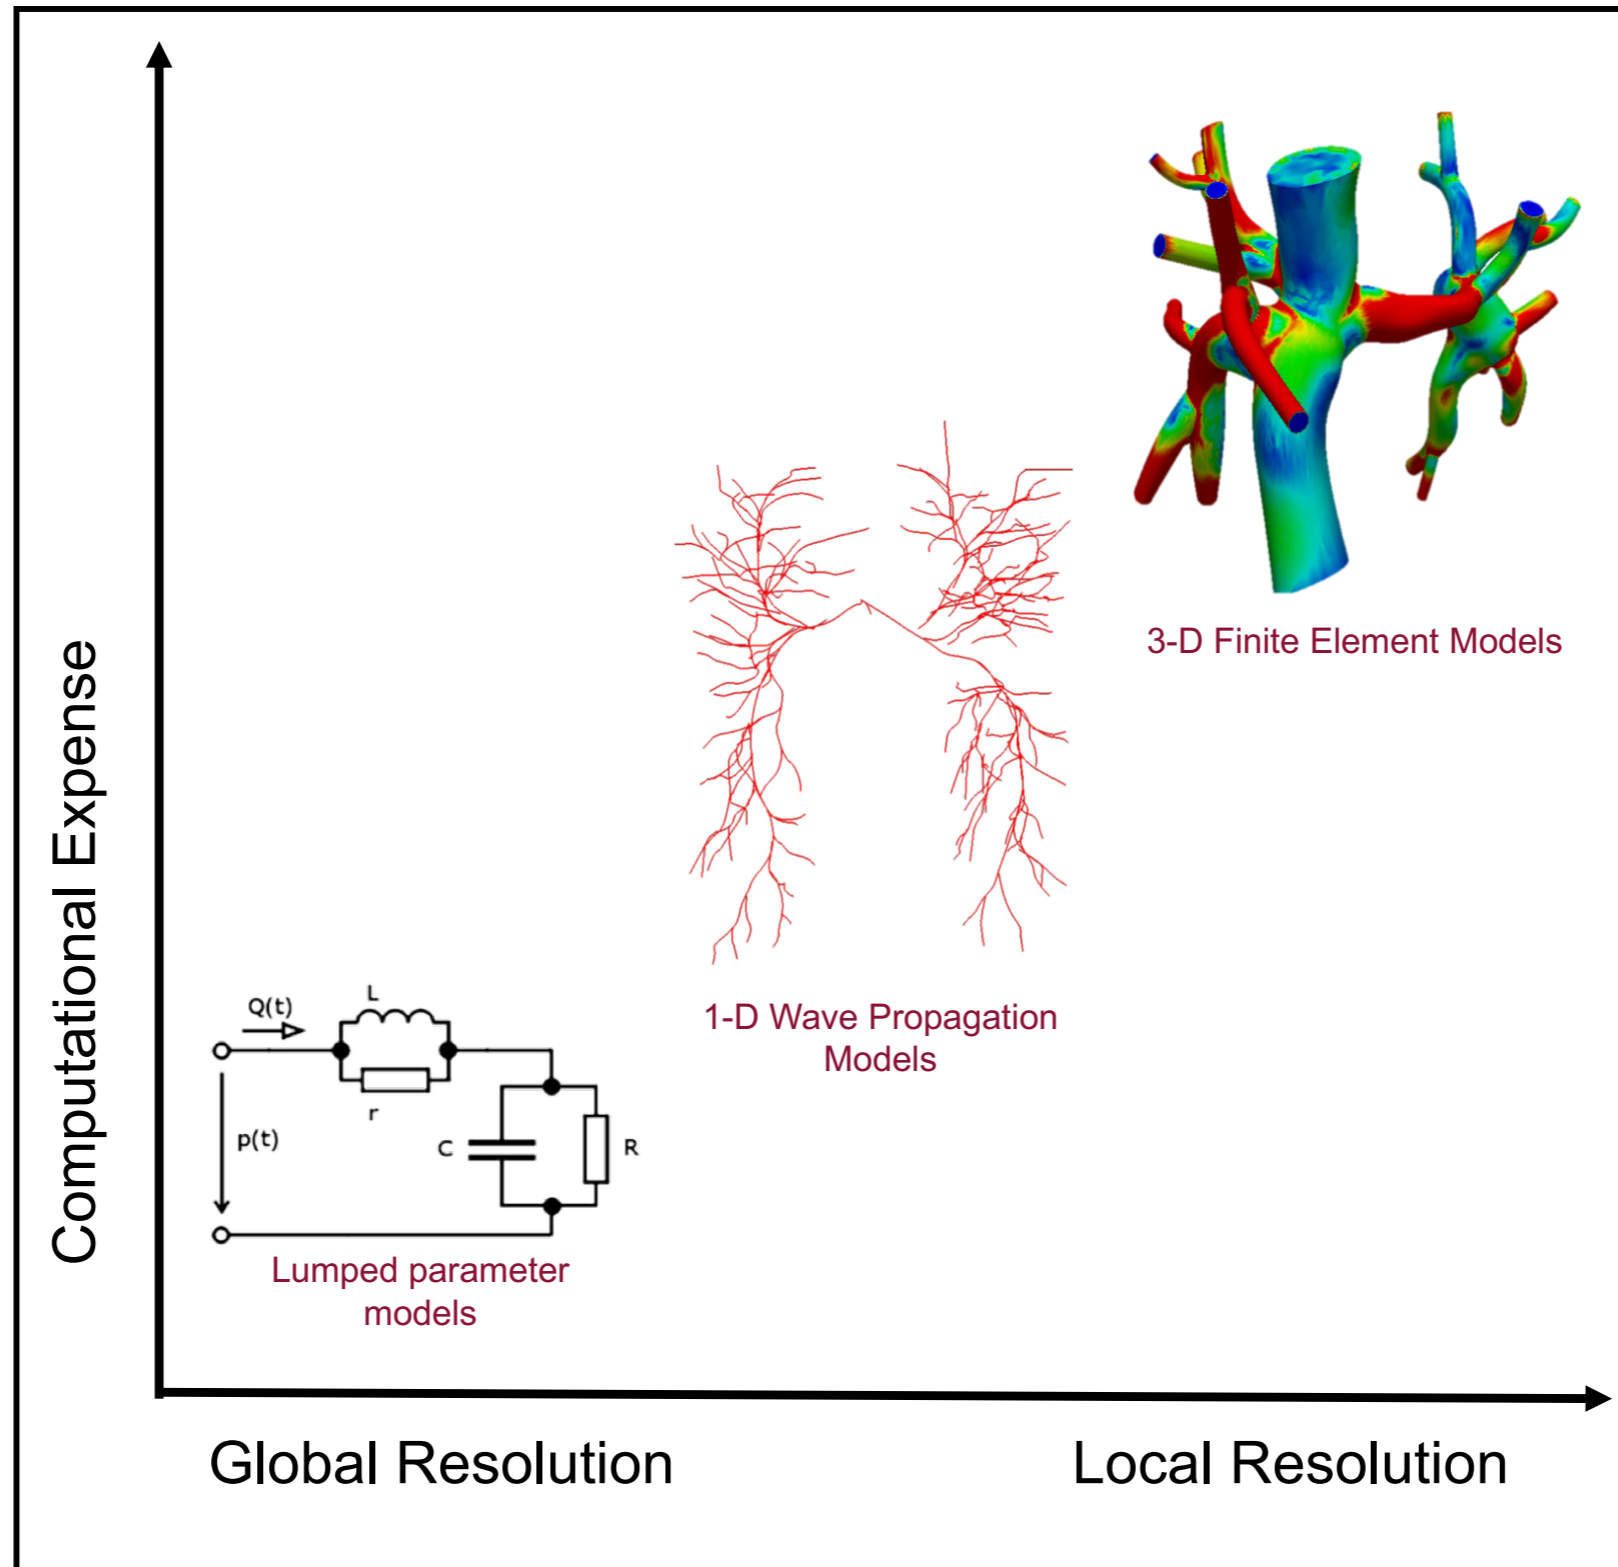

Vascular Growth and Remodeling

Prediction of post-surgical conditions

Mechanobiology

Cardiovascular Model Fidelity

Cardiovascular Modeling: Challenges

Shape Optimization

Interactive Virtual Surgery

Assimilation of clinical data

Fluid Structure Interaction

Uncertainty Quantification

Machine Learning for Image Segmentation

Clinical Applications

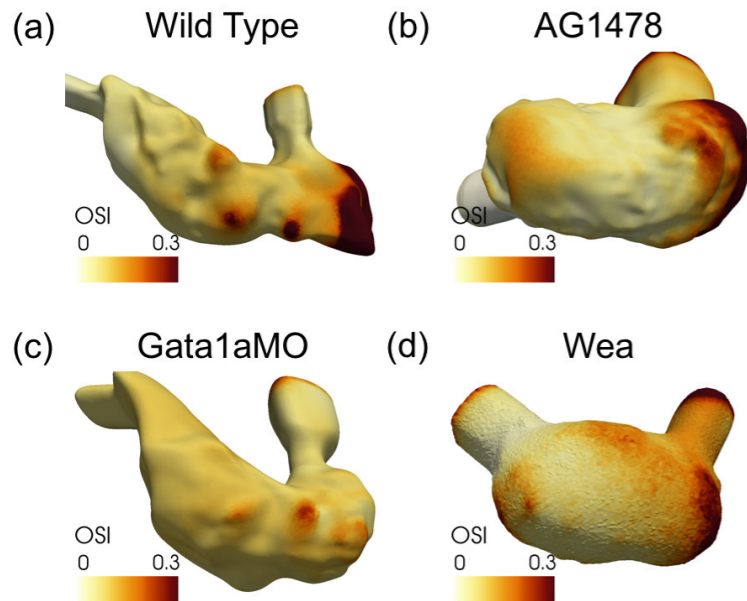

Coronary Artery Bypass Grafts

Single Ventricle Hearts

Aortic Dissection

Cardiac Development

Ventricular Hemodynamics

Pulmonary Hypertension

Abhay Ramachandra

Justin Tran

Owais Khan

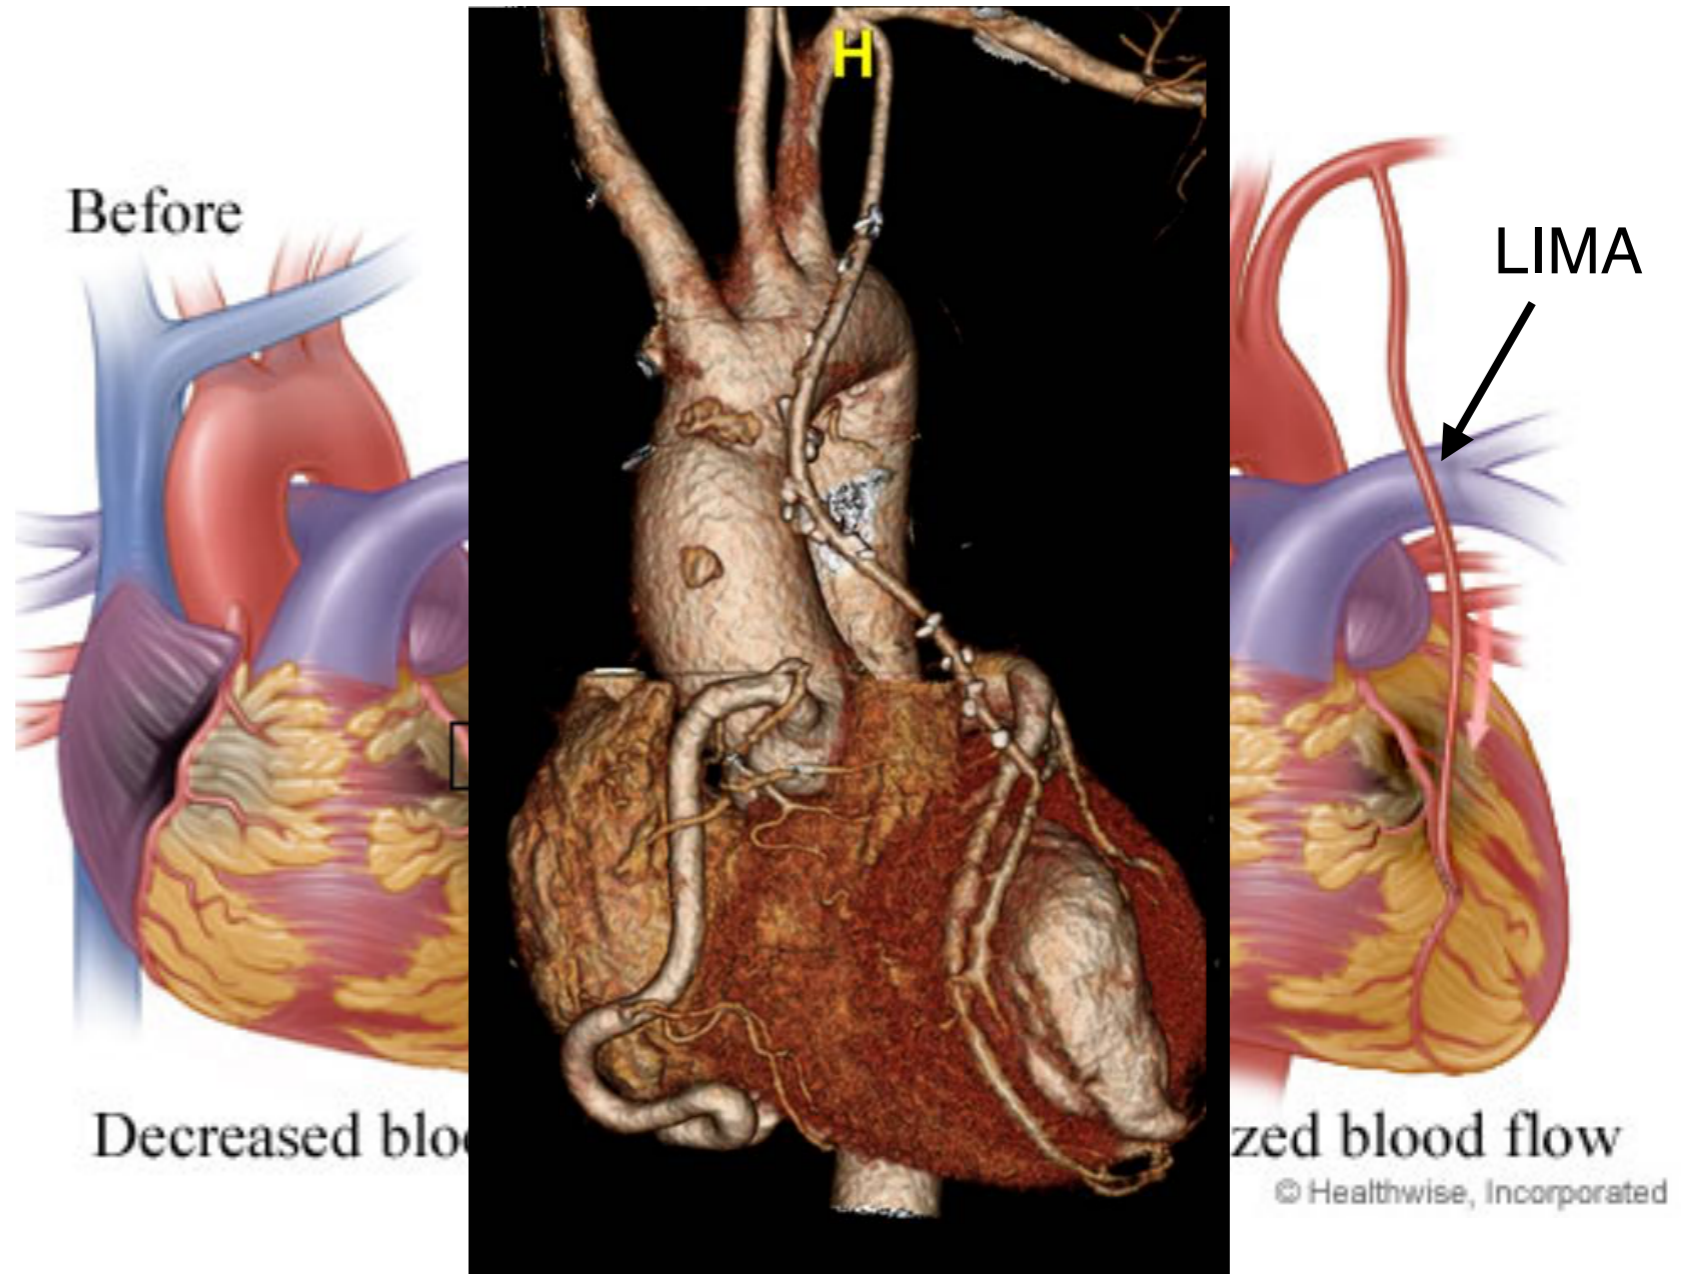

Clinical Examples

Coronary Artery Bypass Surgery

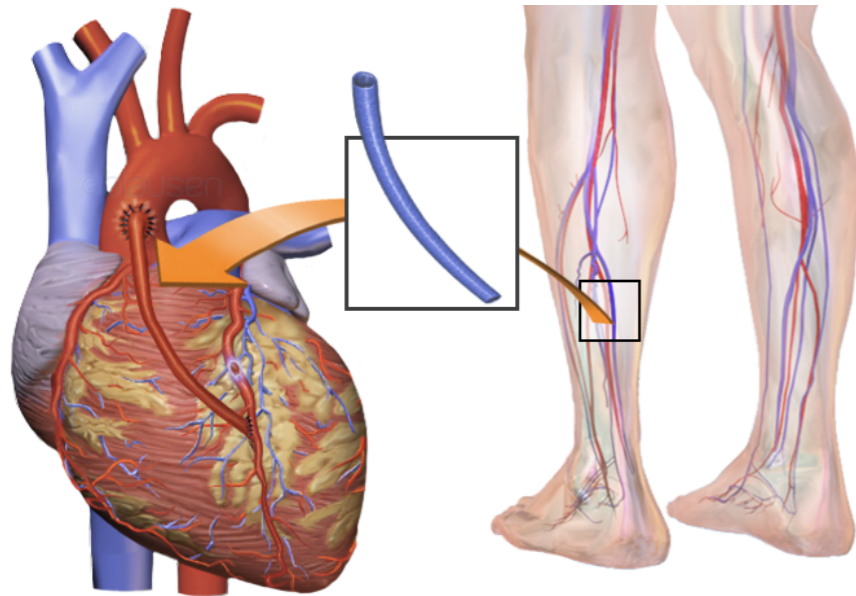

With Andrew Kahn, Jack Boyd, Daniele Schiavazzi

CABG Surgery

- CABG surgery performed in ~400,000 cases annually in US
- Graft options: arterial graft (LIMA), saphenous vein graft (SVG), artificial grafts
- Most patients require multiple grafts
- SVGs are used in majority of patients (70%)
- 50% graft failure within 10 years

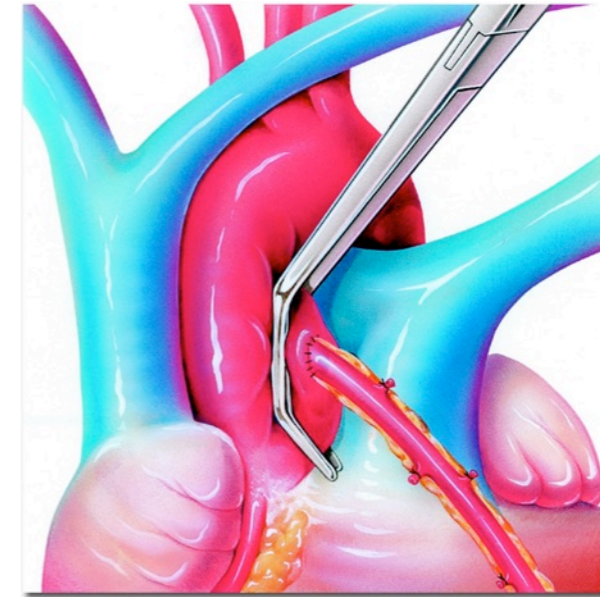

Vein Graft Failure: changing biomechanical loads

Pre-op
Native vein
low pressure, low
flow

*Surgical clamps
removed*

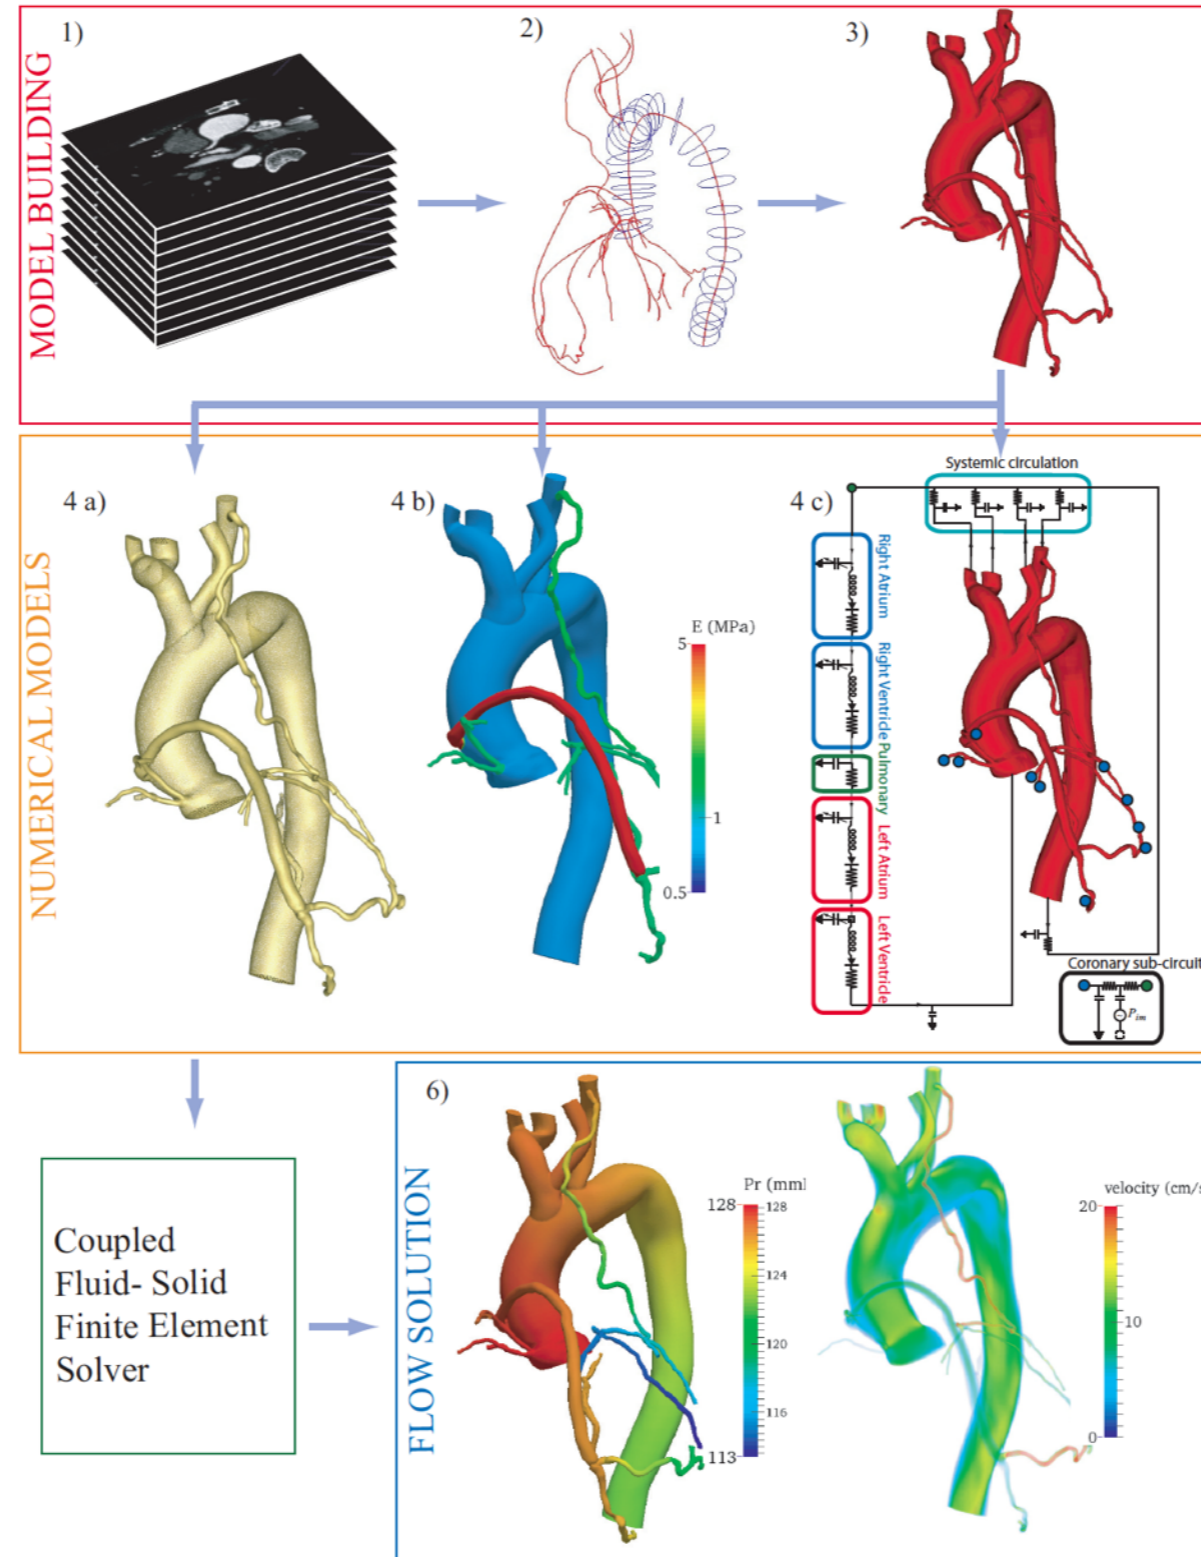

Post-op
20X increase in
pressure
4X increase in flow

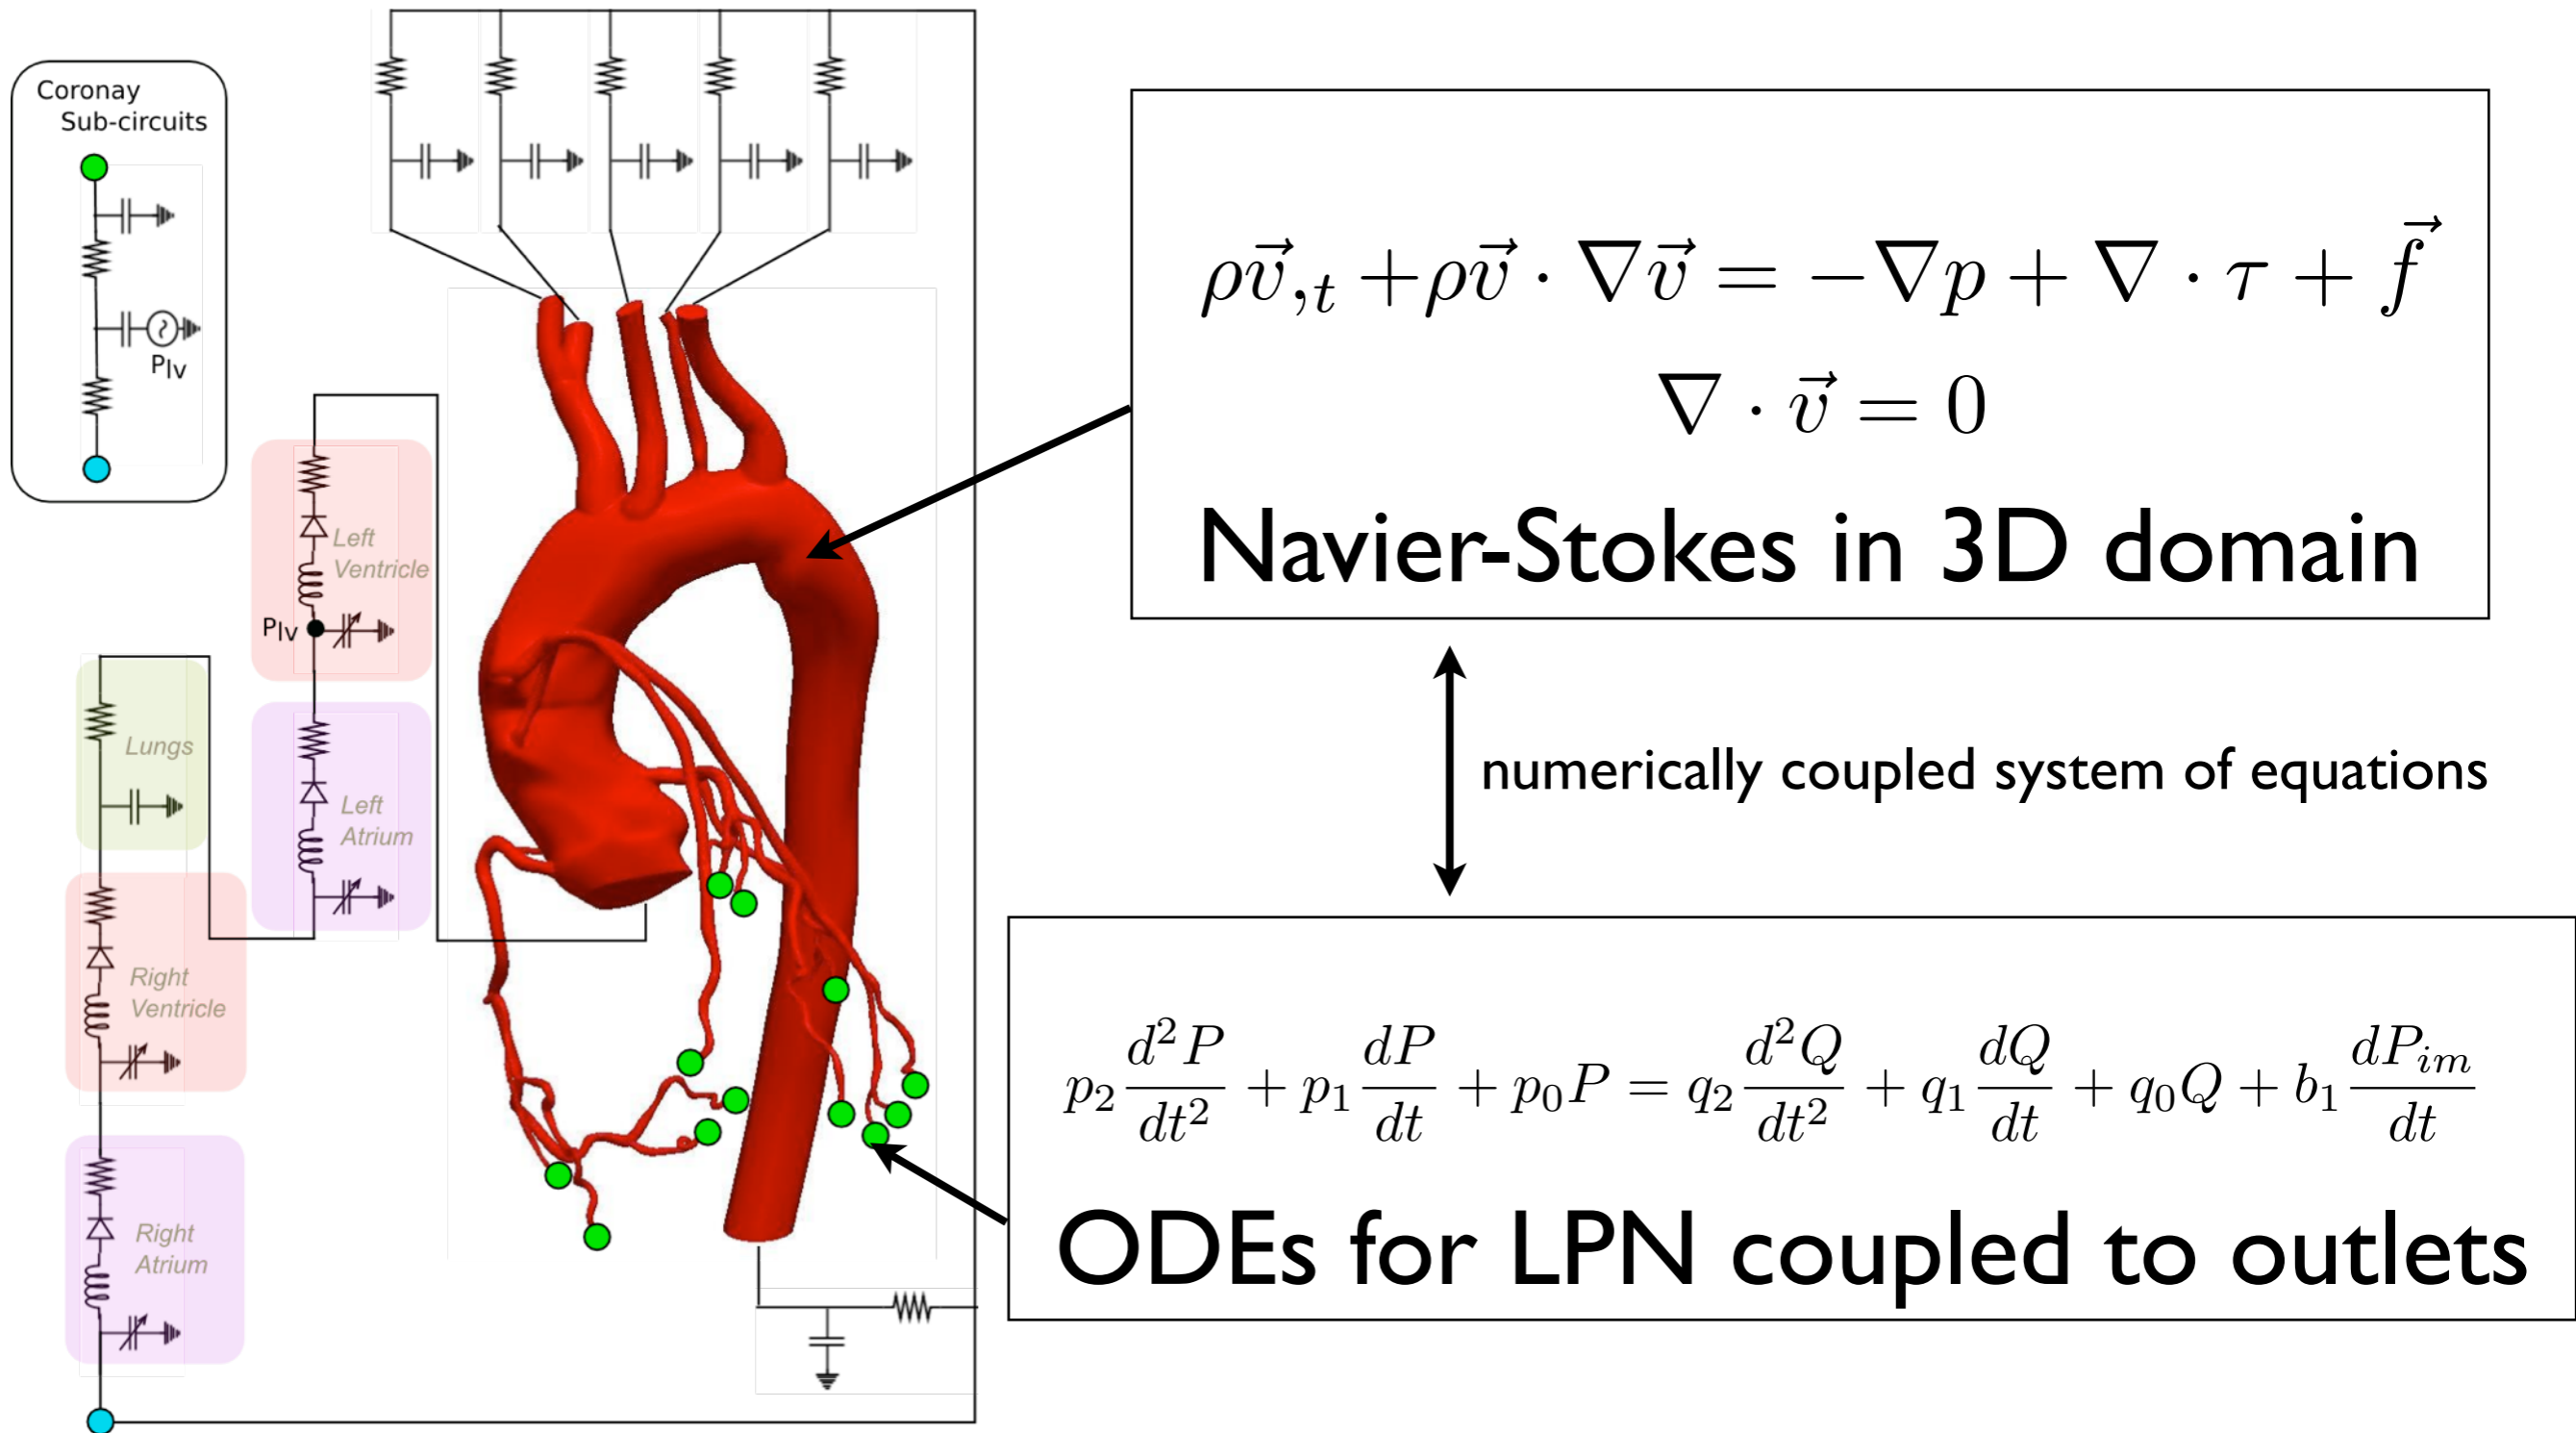

Vein undergoes a complex remodeling process in response to sudden change in mechanical load

CABG Simulation Pipeline

Solution Domains

“Uncertainty quantification of simulated biomechanical stimuli in
coronary bypass grafts,” in review.

Growth and Remodeling

- Adapted Humphrey arterial G&R model to veins
- Predict response to changes in hemodynamics (pressure, shear stress)
- radius, thickness, wall composition
- Test hypotheses of vein graft failure

What is the biomechanical response to altered hemodynamics and wall mechanics in a vein graft?

Vascular G&R Model

Equilibrium Equations

$$P(s)a(s) = T_\theta(s) = \lambda_\theta \sum \frac{\partial W^k}{\partial \lambda_\theta} \quad \text{Circumferential}$$

$$\frac{f(s)}{\pi(2a(s) + h(s))} = T_z(s) = \lambda_z \sum \frac{\partial W^k}{\partial \lambda_z} \quad \text{Axial}$$

Constitutive Equations

$$W^{elastin} = \frac{c^e}{2} (\lambda_\theta^2 + \lambda_z^2 + \lambda_r^2 - 3) \quad \text{Elastin}$$

$$W^k = \frac{c_1^k}{4c_2^k} (e^{(c_2^k(\lambda)^2 - 1)^2} - 1) \quad \text{SMC + Collagen}$$

Mass Addition and Removal

$$m^k = m_0^k (1 + K_1^k \Delta\sigma - K_2^k \Delta\tau_w) \quad \text{Addition}$$

$$q^k(s, \tau) = e^{-\int_\tau^s K^k(\tilde{\tau}) d\tilde{\tau}} \quad \text{Removal}$$

$$K^k(\tilde{\tau}) = K_h^k + K_h^k \Delta\zeta(\tilde{\tau})^2$$

Evolution

$$M^k(s) = M^k(0)Q^k(s) + \int_0^s m^k(\tau)q^k(s, \tau)d\tau \quad \text{Mass}$$

$$W^k(s) = \frac{M^k(0)}{\rho(s)} Q^k(s) \widehat{W}^k(\mathbf{C}_{n(0)}^k(s)) + \int_0^s \frac{m^k(\tau)}{\rho(s)} q^k(s, \tau) \widehat{W}^k(\mathbf{C}_{n(\tau)}^k(s)) d\tau, \quad \text{Stored Energy}$$

Could gradual loading ameliorate vein maladaptation?

$$\mathcal{J}_{adapt} = \sqrt{\left(\frac{\tau_w^h - \tau_w}{\tau_w}\right)^2 + \left(\frac{\sigma_\theta^h - \sigma_\theta}{\sigma_\theta}\right)^2}$$

Measure deviation from homeostasis

Step Change

The diagram shows a horizontal line that abruptly jumps to a higher level, representing a step change.

Gradual Change

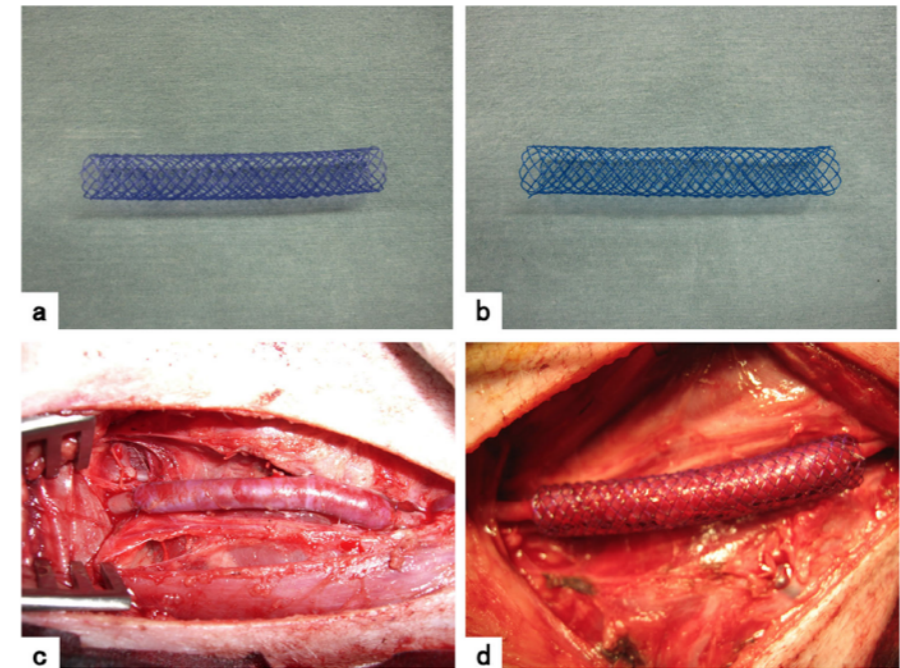

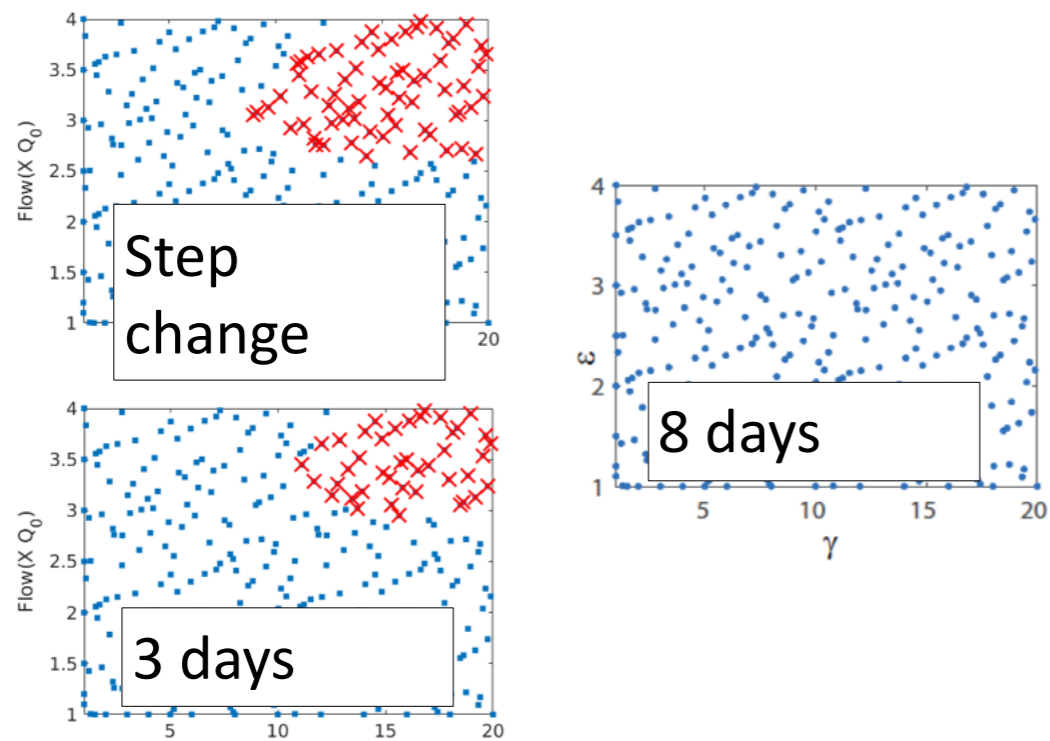

The diagram shows a horizontal line that gradually slopes upward to a higher level, representing a gradual change.

Ramachandra, A. B., Sankaran, S., Humphrey, J.D., Marsden, A.L., “Computational simulation of the adaptive capacity of vein grafts in response to increased pressure,” *Journal of Biomechanical Engineering*, Vol. 137, pp. 031009-1, (2015).

Ramachandra, A. B., Humphrey, J. D., Marsden, A. L., “Gradual loading ameliorates maladaptation in computational simulations of vein graft growth and remodeling,” *Journal of the Royal Society Interface*, Vol. 14 (130), May 2017.

Evidence of benefit of gradual loading

A novel biodegradable external mesh stent improved long-term patency of vein grafts by inhibiting intimal-medial hyperplasia in an experimental canine model

PH Cohort with Varying Disease Severity

Control:

Moderate:

Severe:

Proximal vessels: WSS

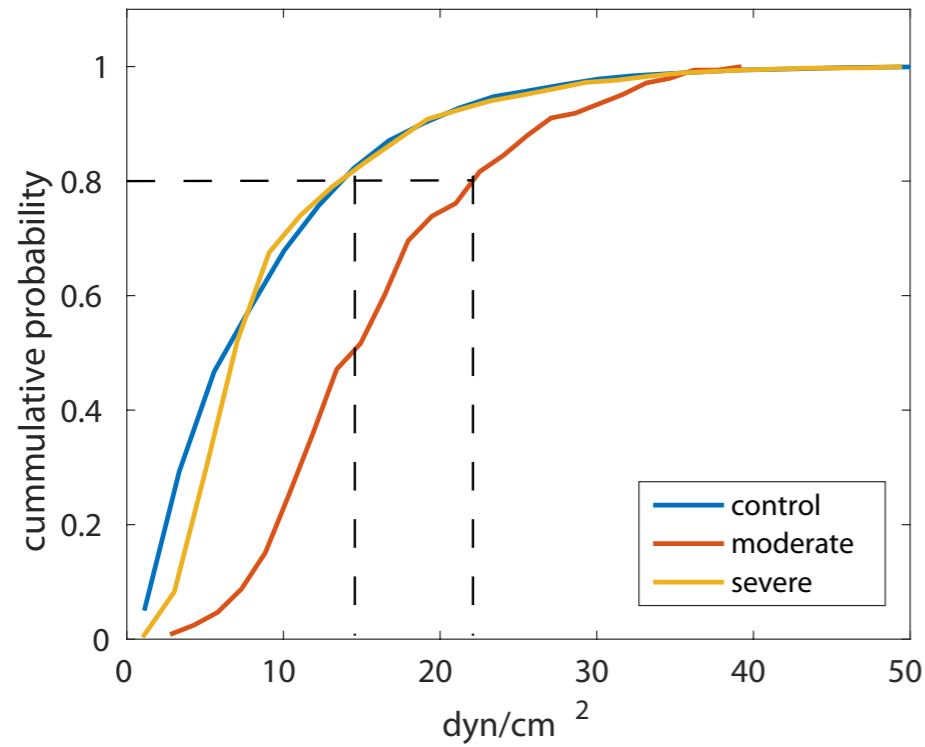

MPA WSS is significantly decreased in moderate and severe patients

Distal vessels: WSS

$D > 500\mu m$

$100\mu m < D < 500\mu m$

$D < 100\mu m$

Ju Liu

Towards Fluid Solid Growth

An integrated framework for solid-fluid mechanics

Challenges of incompressible solids

- Biological tissues are incompressible with Poisson ratio = 0.5
- Most solid mechanics codes inadequately deal with incompressible materials
- Limitations in element type or model complexity
- “Fudge” material properties
- Linear tetrahedral elements lead to well-known “locking” phenomenon

Helmholtz vs. Gibbs

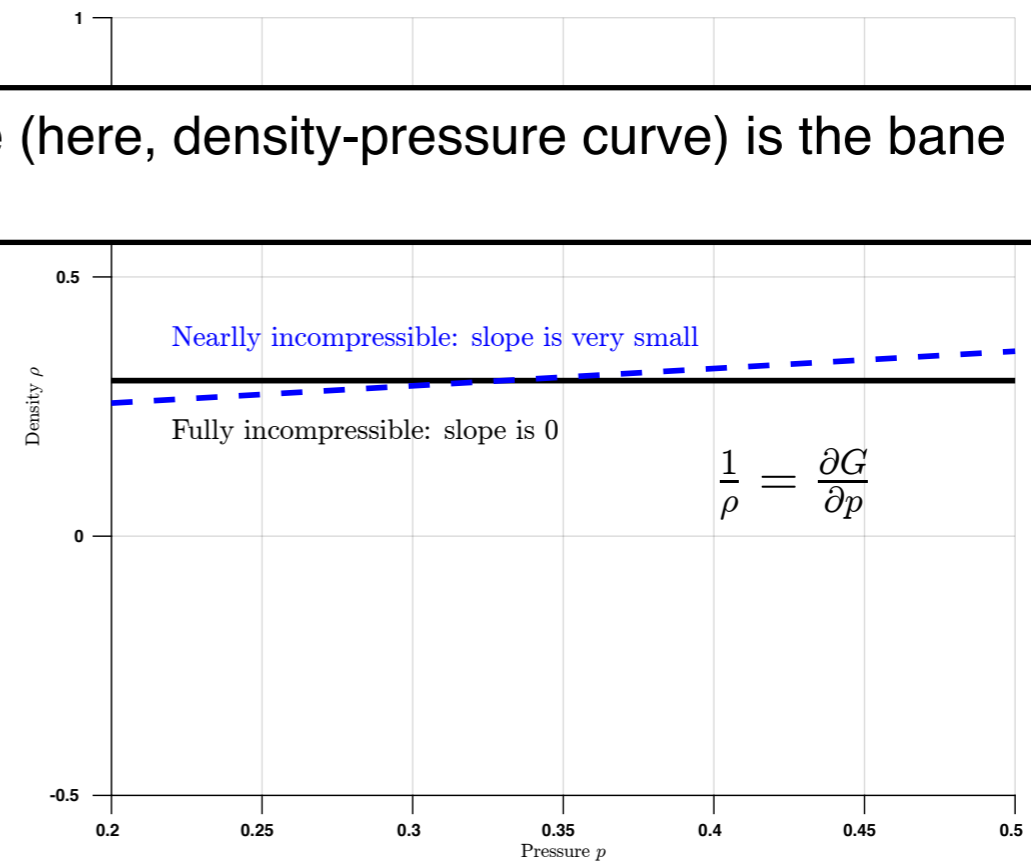

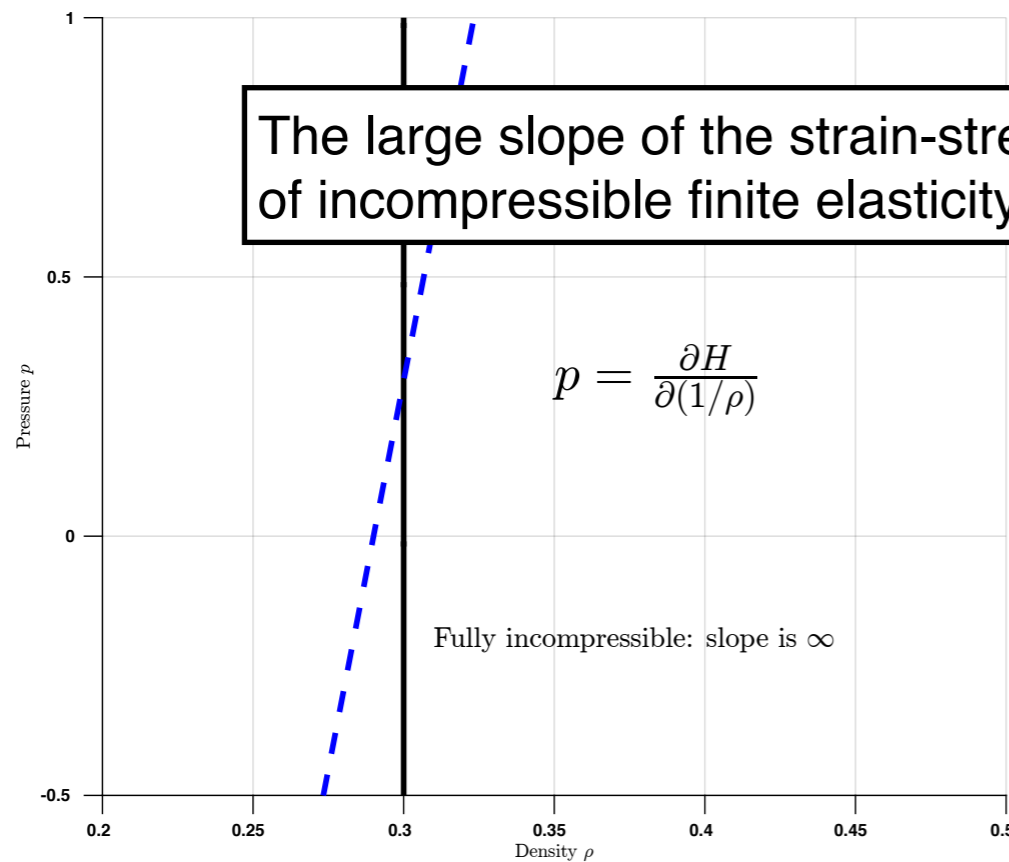

H. Helmholtz (1821-1894)

A.M. Legendre
(1752-1833)

J.W. Gibbs (1839-1903)

The large slope of the strain-stress curve (here, density-pressure curve) is the bane of incompressible finite elasticity solvers

A unified framework for fluids and solids

- Compressible and incompressible Navier Stokes
- Compressible and incompressible hyper-elastodynamics
- Inelastic materials (anisotropic visco-hyper-elastodynamics, elastoplasticity, etc.)

$$\left\{ \begin{array}{l} 0 = \frac{d\mathbf{u}}{dt} - \mathbf{v}, \text{ or a mesh motion equation for ALE-CFD,} \\ \\ 0 = \frac{d\rho}{dt} + \rho \nabla \cdot \mathbf{v} \\ \\ 0 = \rho \frac{d\mathbf{v}}{dt} - \nabla \cdot \boldsymbol{\sigma}^{\text{dev}} + \nabla p - \rho \mathbf{b} \end{array} \right.$$

Elasticity :

$$\boldsymbol{\sigma}^{\text{dev}} = \mathbf{J}^{-1} \tilde{\mathbf{F}} (\mathbb{P} : \tilde{\mathbf{S}}) \tilde{\mathbf{F}}^T, \quad \tilde{\mathbf{S}} = 2 \frac{\partial \tilde{\mathbf{G}}}{\partial \tilde{\mathbf{C}}}, \quad \rho^{-1} = \frac{d\hat{\mathbf{G}}}{dp}, \quad \beta_\theta = -\frac{d^2 \hat{\mathbf{G}}}{dp^2} / \frac{d\hat{\mathbf{G}}}{dp}.$$

Viscous fluids:

$$\boldsymbol{\sigma}^{\text{dev}} = \bar{\mu} (\nabla \mathbf{v} + \nabla \mathbf{v}^T) + \bar{\lambda} \nabla \cdot \mathbf{v} \mathbf{I}.$$
