

Regularized Extended Finite Volume Method (XFVM) for Flow Induced Shear Failure

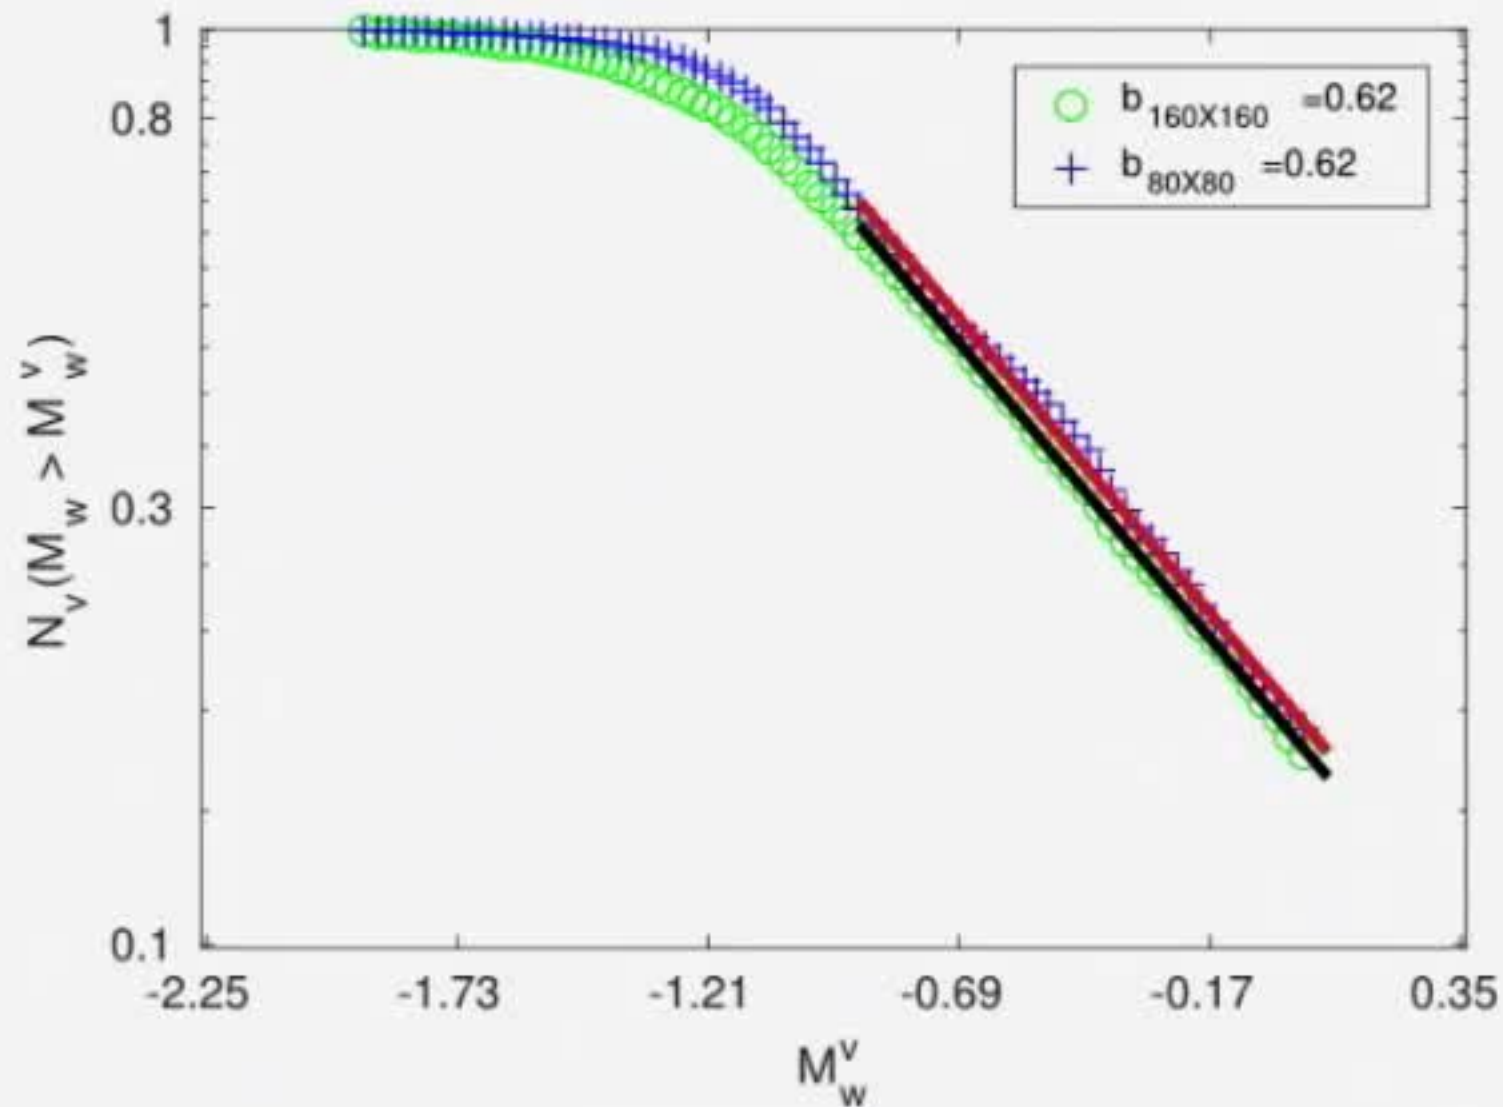

Rajdeep Deb and Patrick Jenny

Conclusions

- Embedded discrete fracture model for flow induced shear failure
- XFVM to deal with discontinuities
- Shear strength relaxation to regularize failure events
- Realistic, grid independent seismic magnitude statistics
- Realistic response on matrix permeability
- Strong effect of matrix heterogeneity
- 3D XFVM EDFM with shear failure and tensile opening

- Next: tensile failure

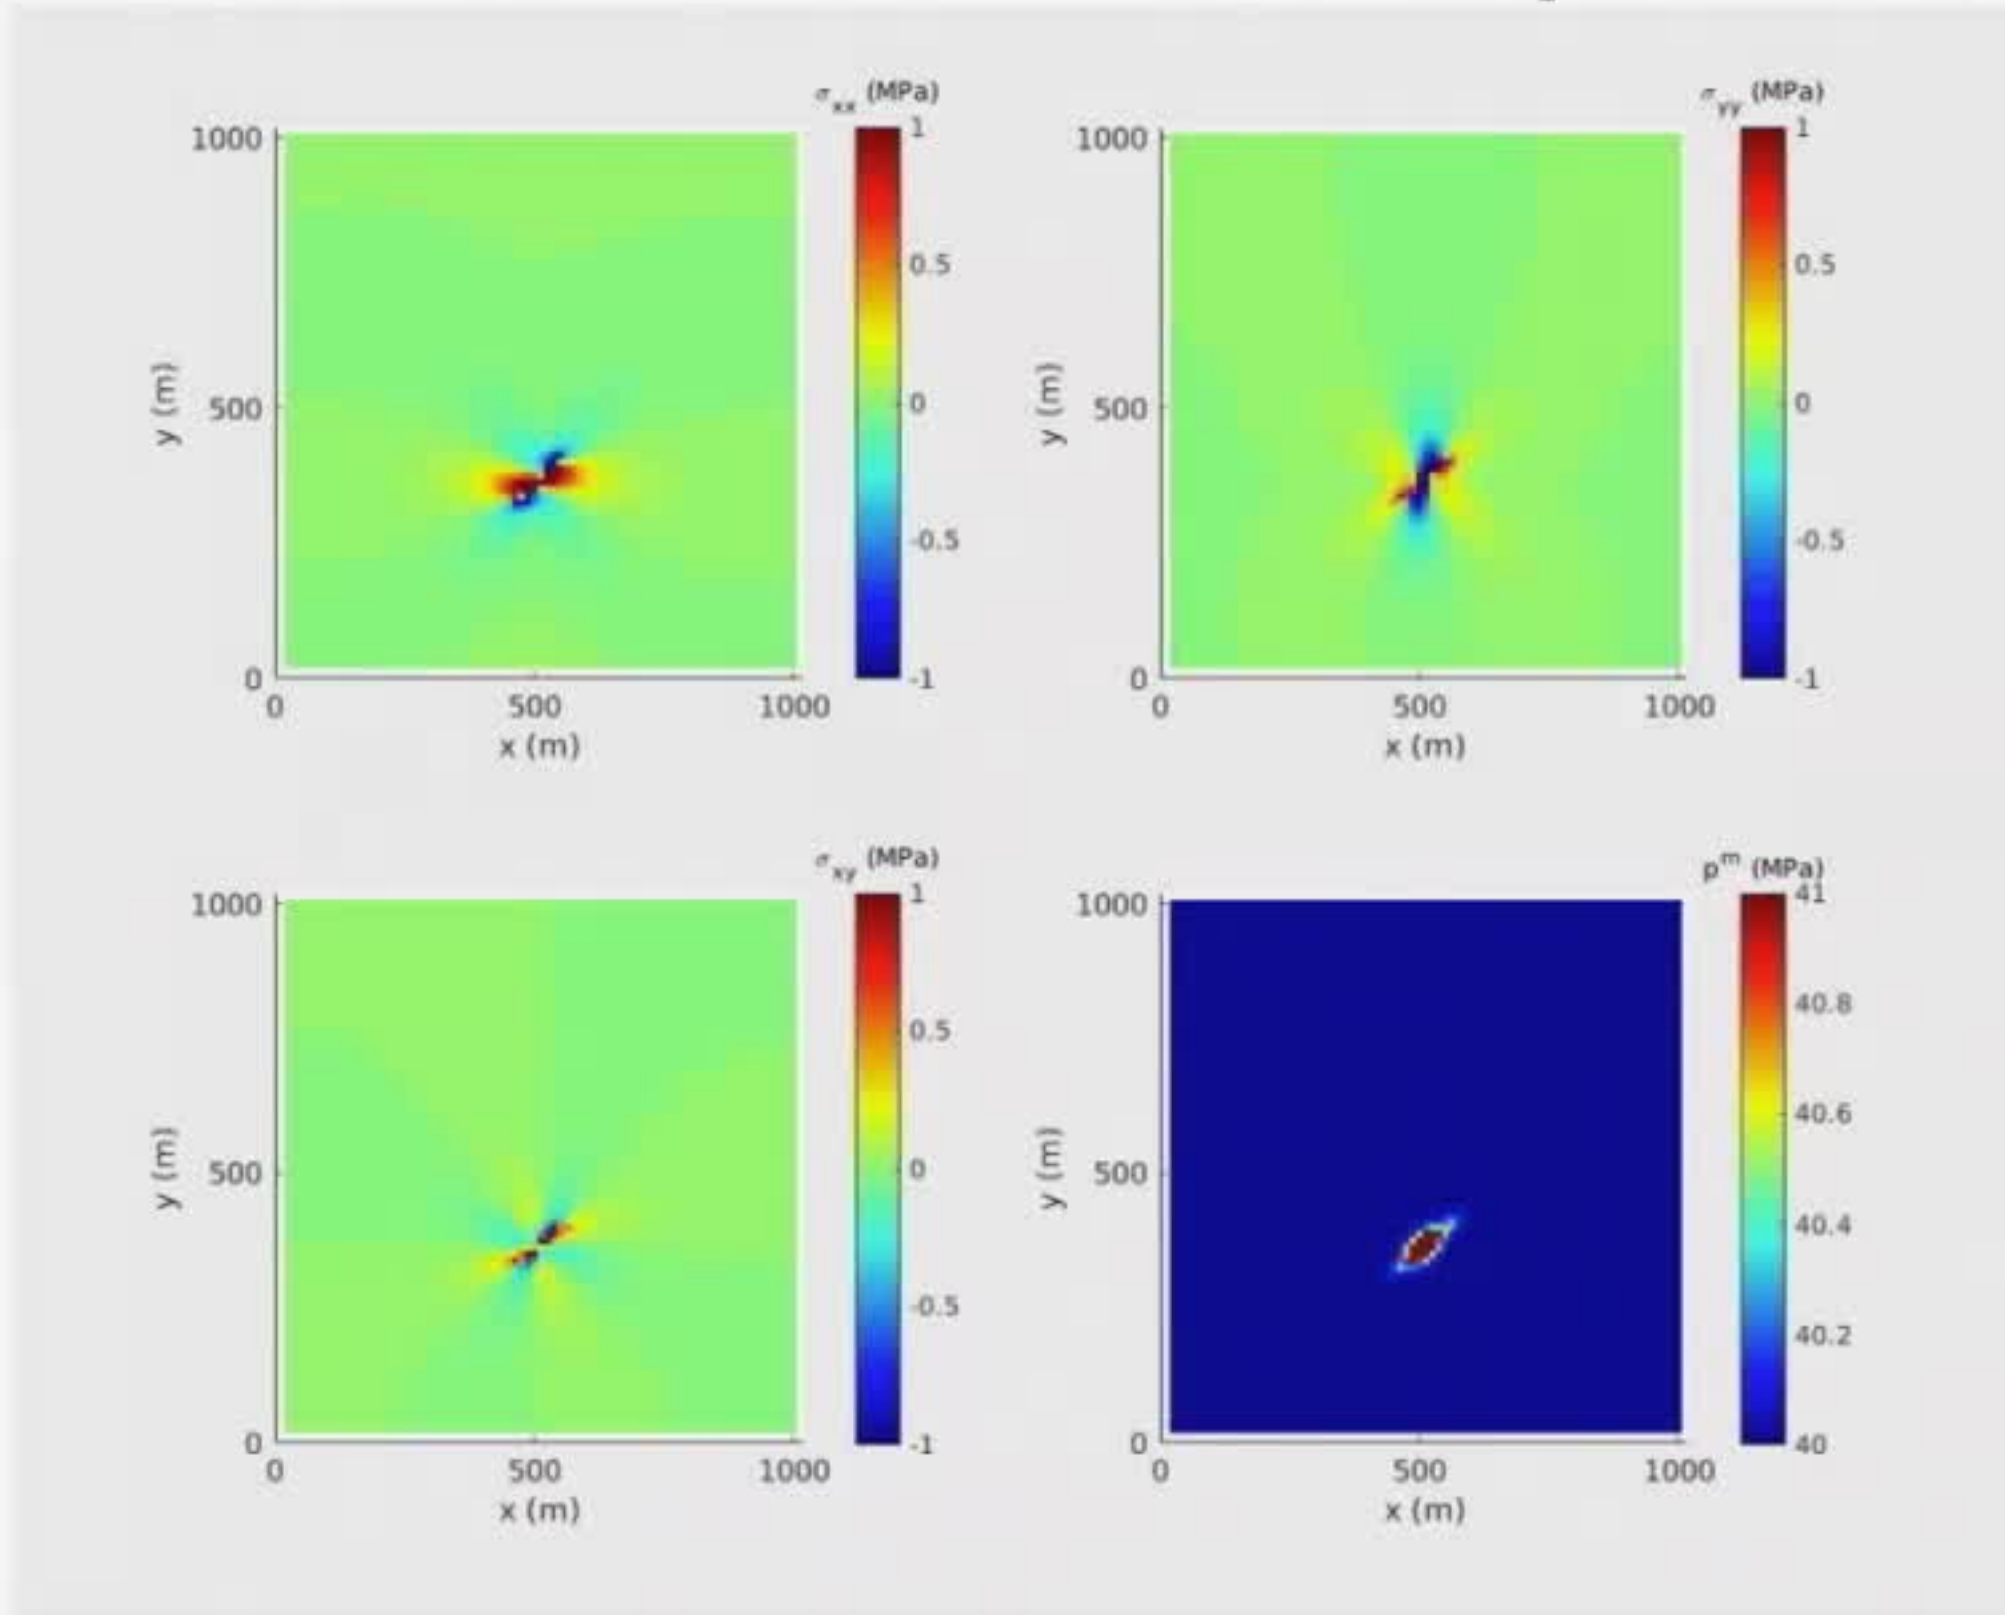

Flow Induced Shear Failure: Seismicity

$$M_w = \frac{2}{3} \log \left(GA \sum |\Delta s_i| \right) - 10.73$$

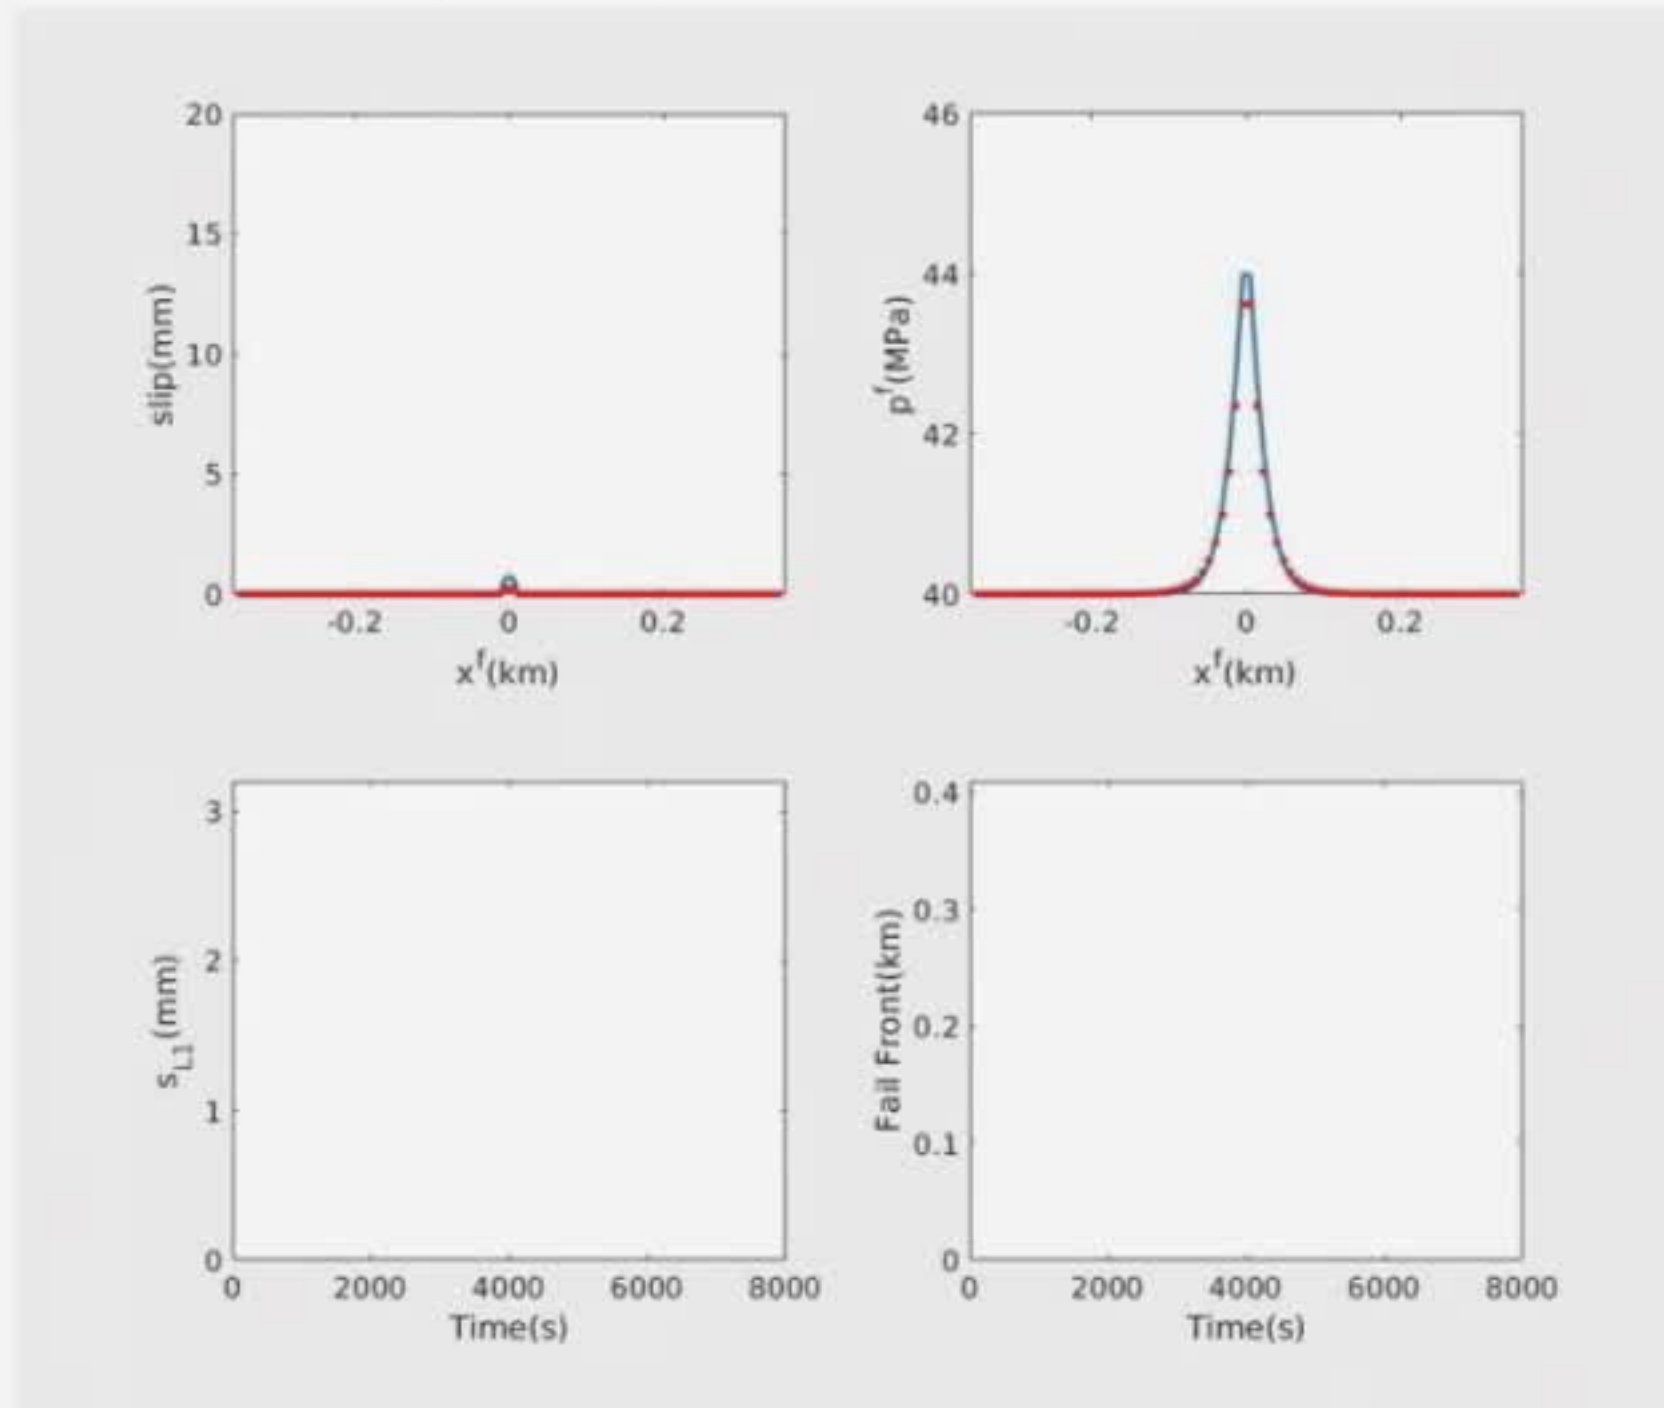

[Hanks and Kanamori, JGR, 84, 1975]

Flow Induced Shear Failure: Multiple Fractures

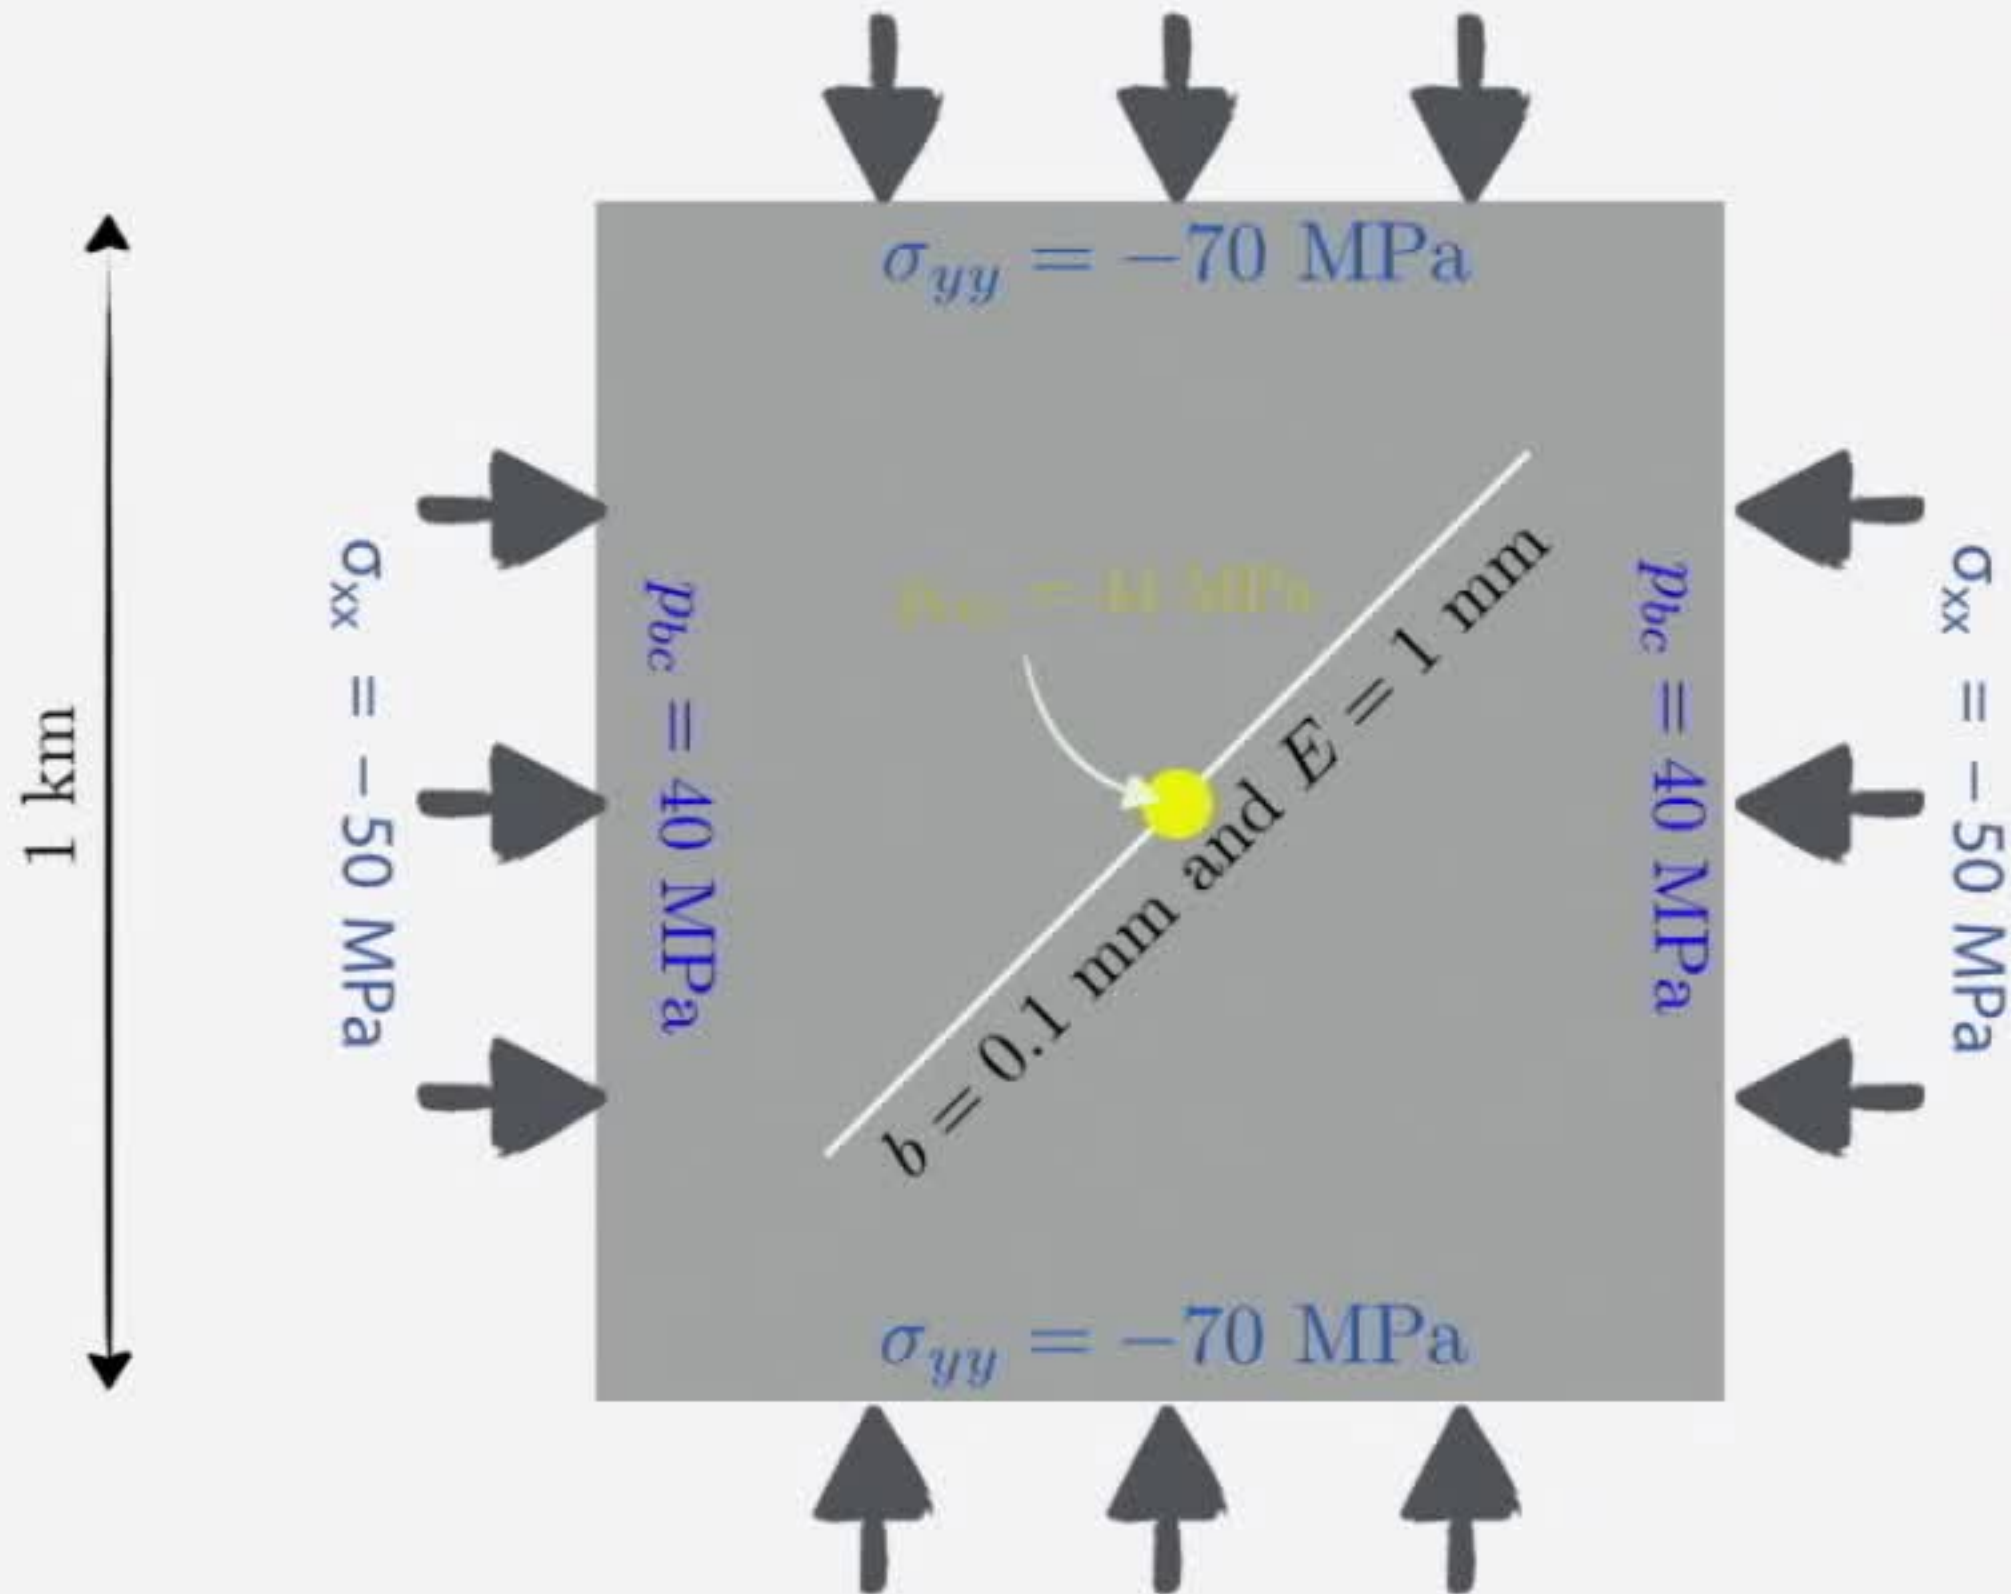

Flow Induced Shear Failure: Effect of Regularization

Time step comparison without relaxation

Flow Induced Shear Failure: Single Fracture

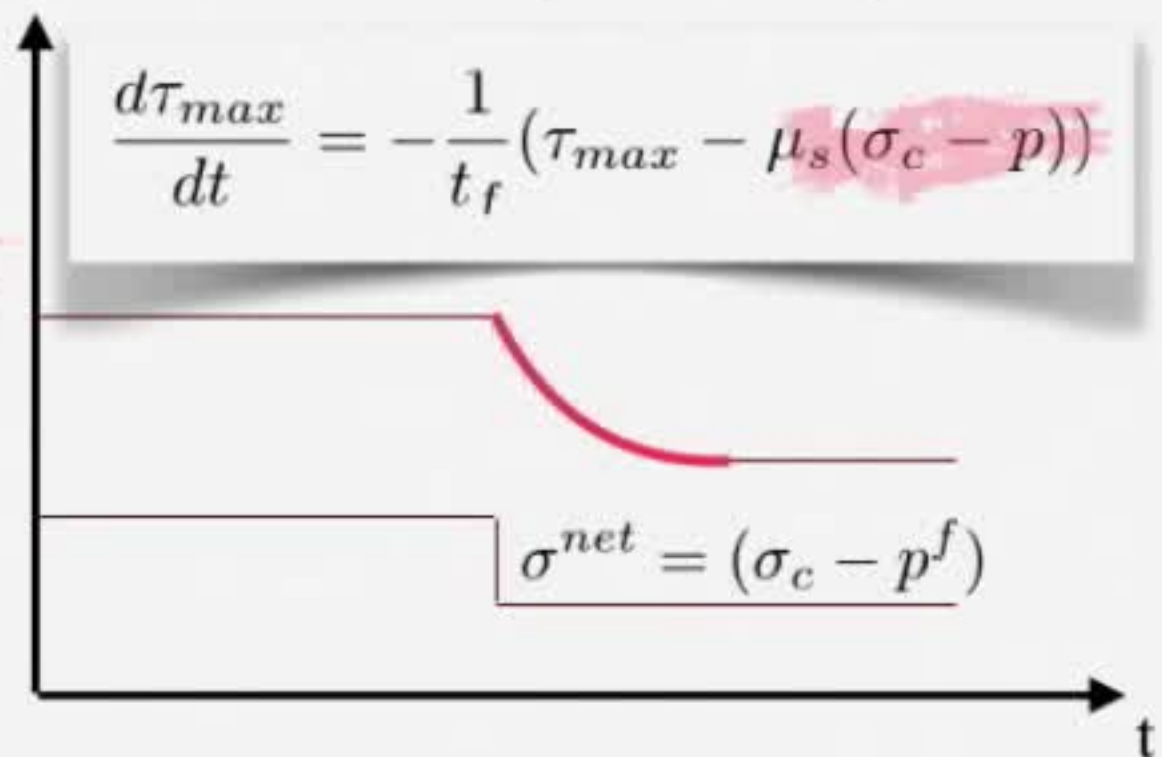

Flow Induced Shear Failure: Regularization

Regularization achieved via shear strength relaxation:

[Prakash and Clifton, ASME 1993]

Flow Induced Shear Failure: Regularization

Immediate change in traction maximum due to change in compressive stress:

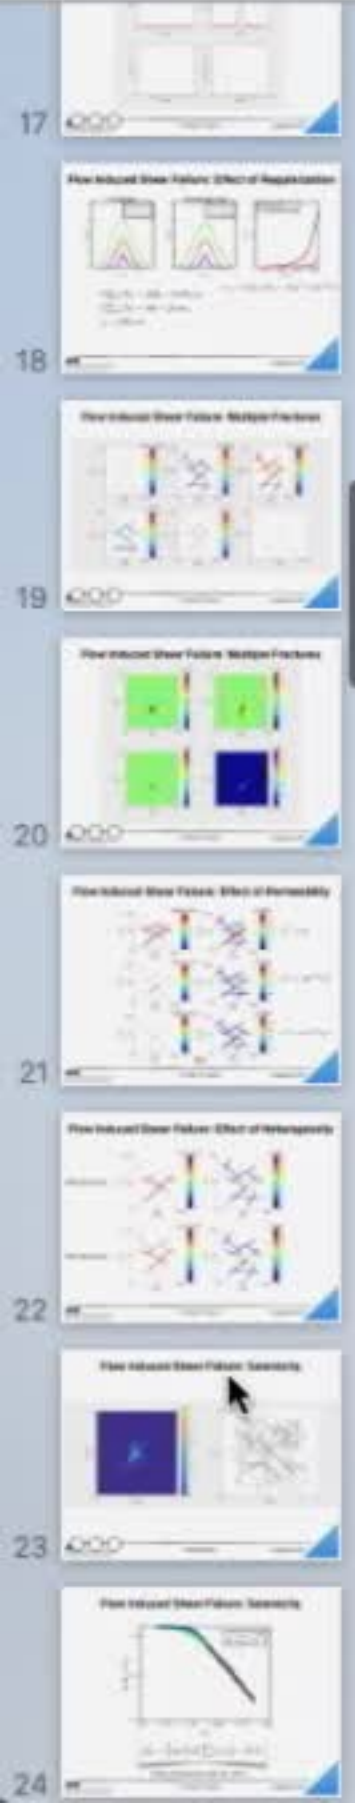

Coulomb friction law:

$$\tau_{max} = \mu_s (\sigma_c - p^f)$$

$$\sigma^{net} = (\sigma_c - p^f)$$
