

Discovery of Latent Factors in High-dimensional Data via Spectral Methods

Furong Huang

University of Maryland

Presented by Xuchen You

2018 SIAM Annual Meeting (AN18)

Machine Learning - Excitements

Success of Supervised Learning

Image classification

Speech recognition

Text processing

Key to Success

- Deep composition of nonlinear units
- Enormous labeled data
- Computation power growth

Machine Learning - Modern Challenges

Automated discovery of features and categories?

Real AI requires **Unsupervised Learning**

Filter bank learning

Feature extraction

Embeddings, Topics

- Summarize key features in data
 - ▶ State-of-the-art: Humans are better than machines
 - ▶ Goal: Intelligent machines that summarize key features in data
- Interpretable modeling and learning of the data
 - ▶ Theoretically guaranteed learning
 - ▶ Extracted features are interpretable

Unsupervised Learning with Big Data

Information Extraction

- **High dimension observation** vs **Low dimension representation**

My Solution: A Unified Tensor Decomposition Framework

App 1: Automated Categorization of Documents

The screenshot shows a web page from The New York Times. At the top, there are navigation links for 'SECTIONS', 'HOME', and 'SEARCH', and the newspaper's name 'The New York Times'. Below this is a sub-header 'COLLEGE FOOTBALL' and the article title 'At Florida State, Football Clouds Justice'. The main text of the article is visible, with several words highlighted in yellow: 'police', 'witnesses', 'investigations', 'campus police', 'prosecutor', 'gases', 'investigation', and 'police'. To the right of the article, there is a 'Topics' section with three colored circles: a purple circle for 'Education', a yellow circle for 'Crime', and a cyan circle for 'Sports'. The article text is partially obscured by these topic tags.

Document modeling

- Observed: words in document corpus: search logs, emails etc
- Hidden: (mixed) topics: personal interests, professional area etc

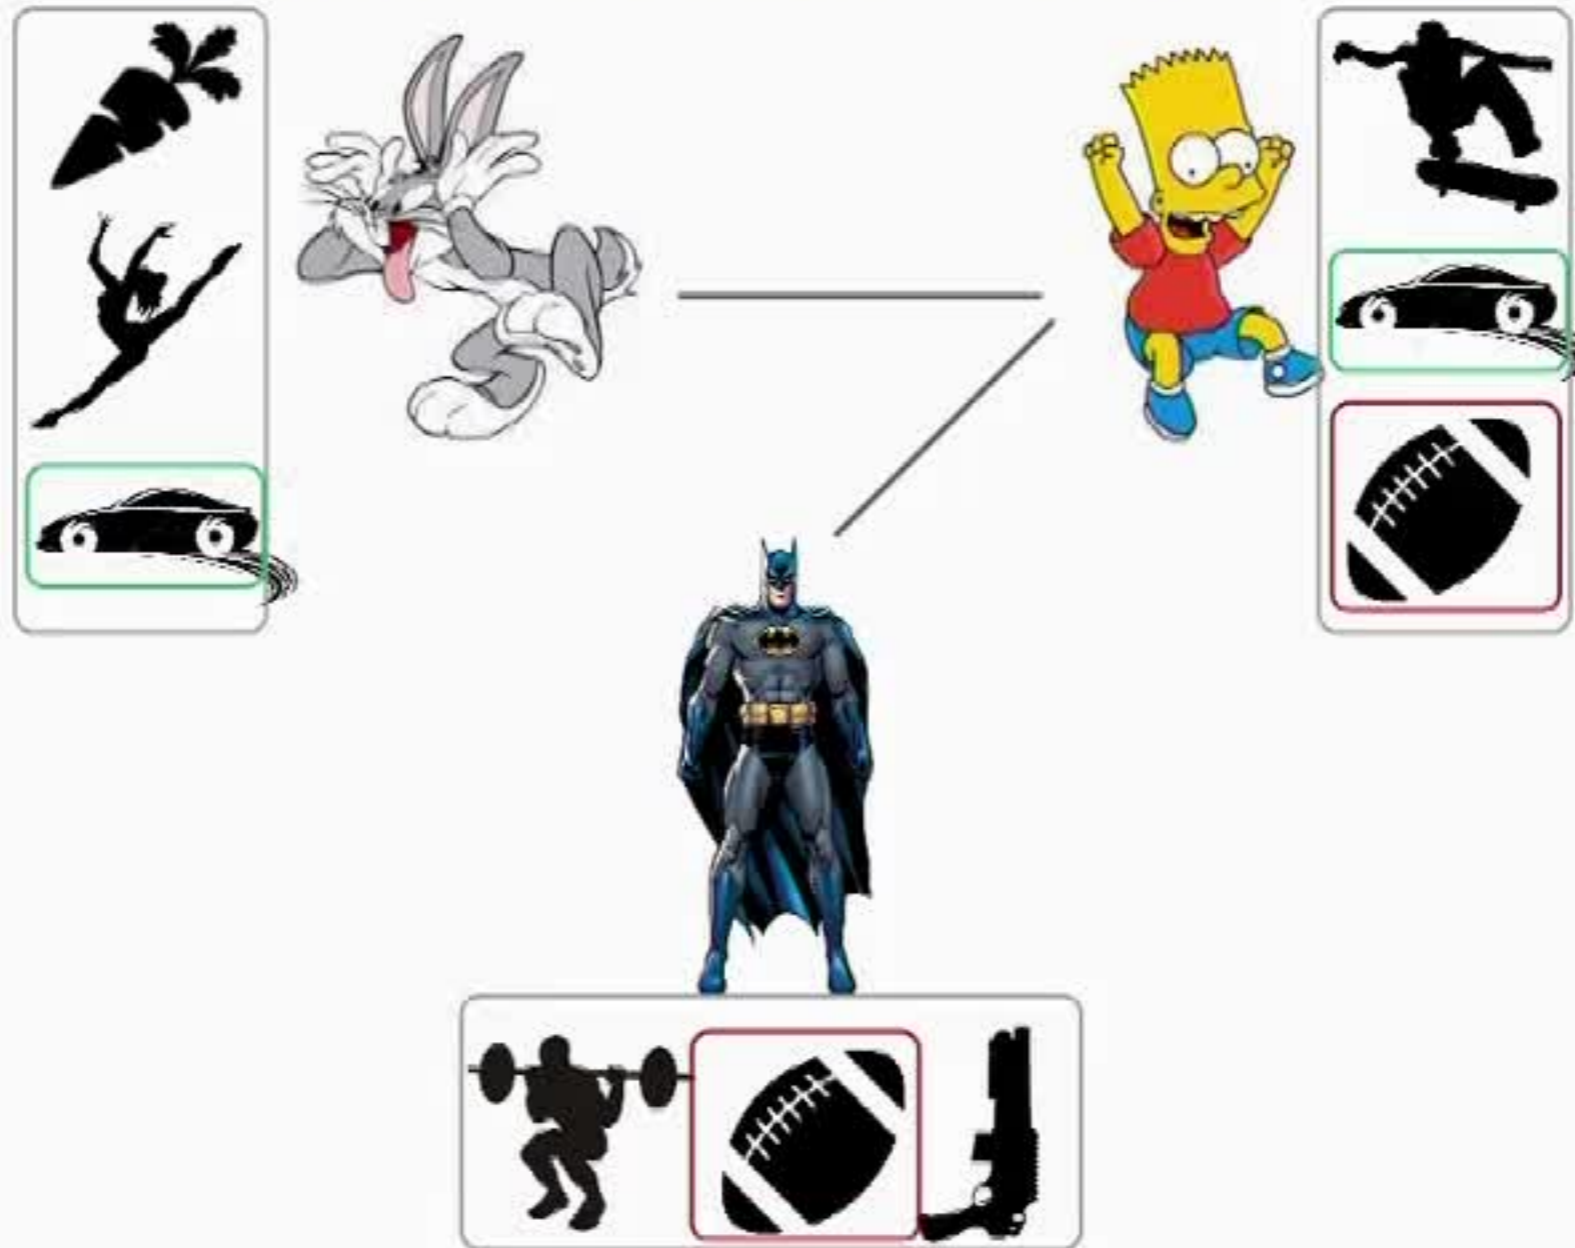

App 2: Community Extraction From Connectivity Graph

Social Networks

- Observed: network of social ties: friendships, transactions etc
- Hidden: (mixed) groups/communities of social actors

App 2: Community Extraction From Connectivity Graph

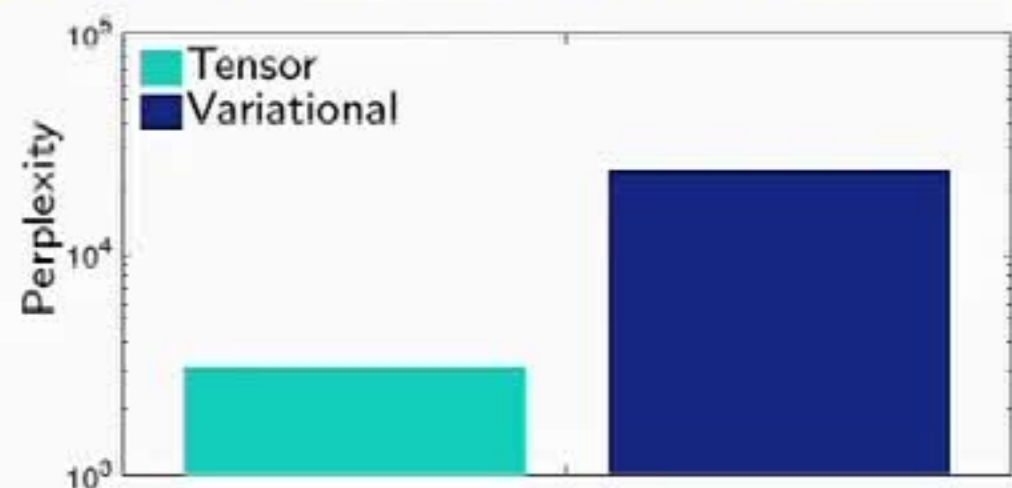

Social Networks

- **Observed:** network of social ties: friendships, transactions etc
- **Hidden:** (mixed) groups/communities of social actors

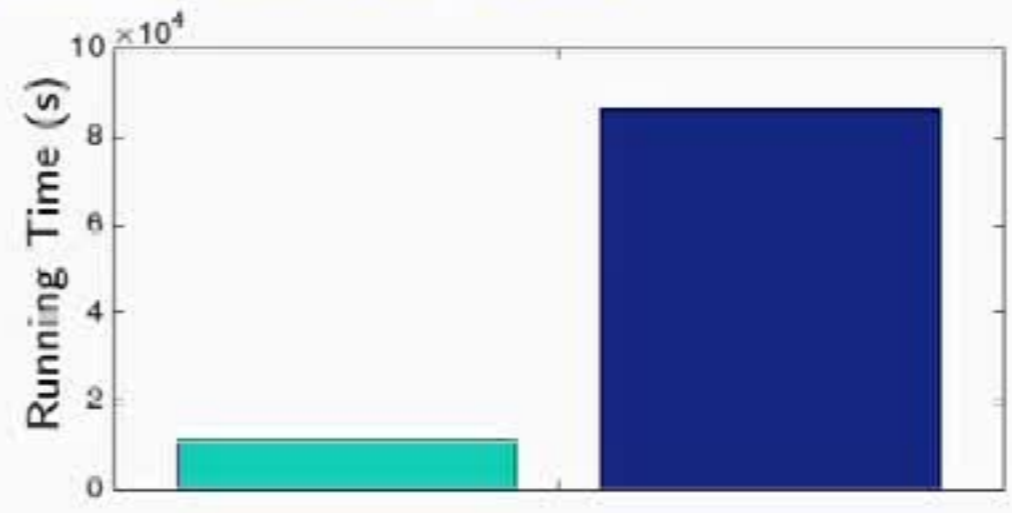

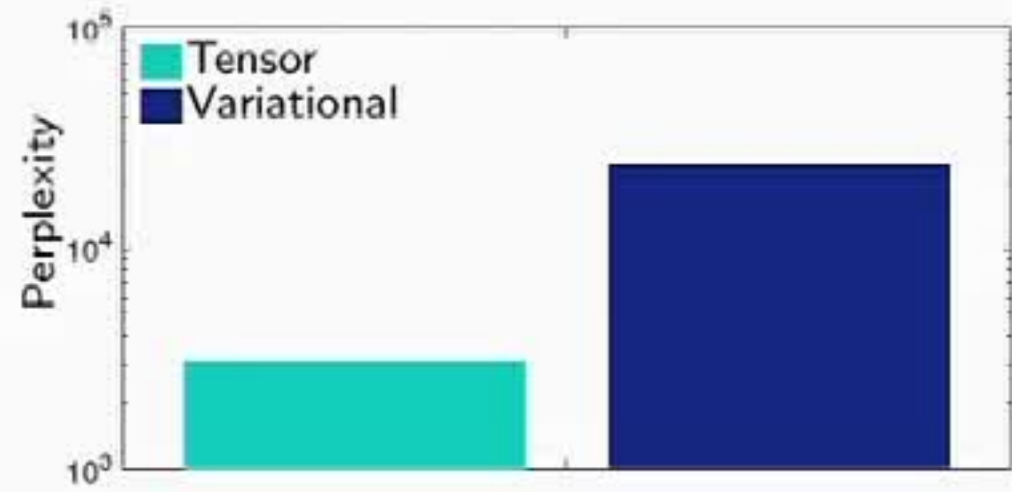

Tensor Methods Compared with Variational Inference

Learning Topics from PubMed on Spark: 8 million docs

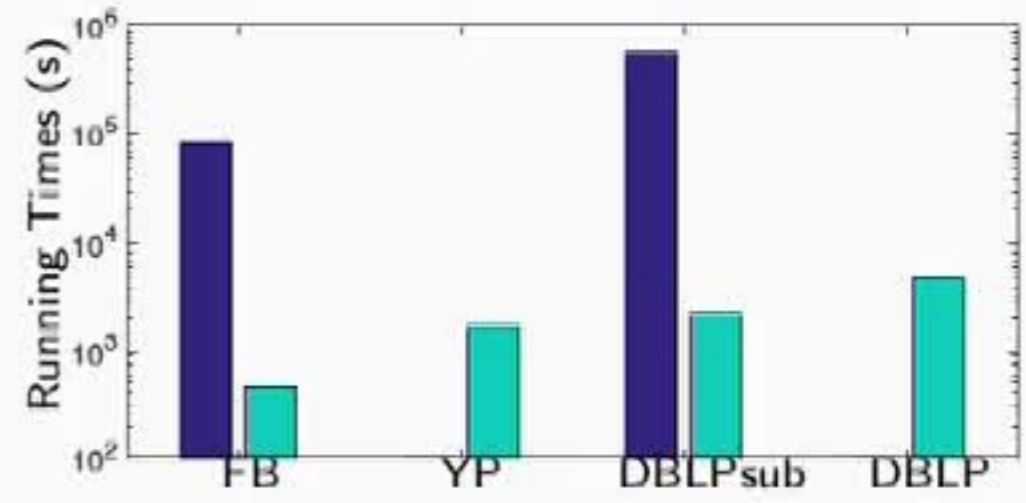

Tensor Methods Compared with Variational Inference

Learning Topics from PubMed on Spark: 8 million docs

Learning Communities from Graph Connectivity

Facebook: $n \sim 20k$ Yelp: $n \sim 40k$ DBLPsub: $n \sim 0.1m$ DBLP: $n \sim 1m$

Tensor Methods Compared with Variational Inference

Learning Topics from PubMed on Spark: 8 million docs

Learning Communities from Graph Connectivity

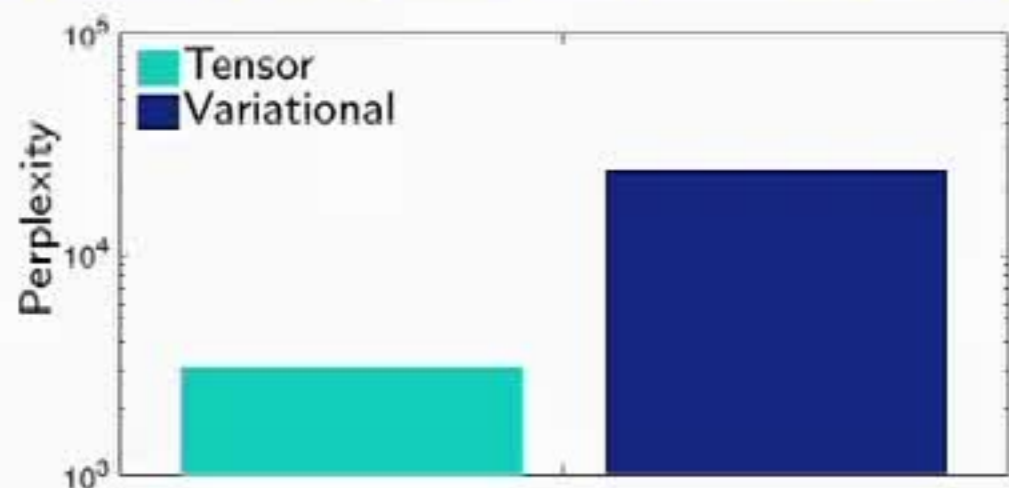

pub: $n \sim 0.1m$

DBLP: $n \sim 1m$

Tensor & More Accurate

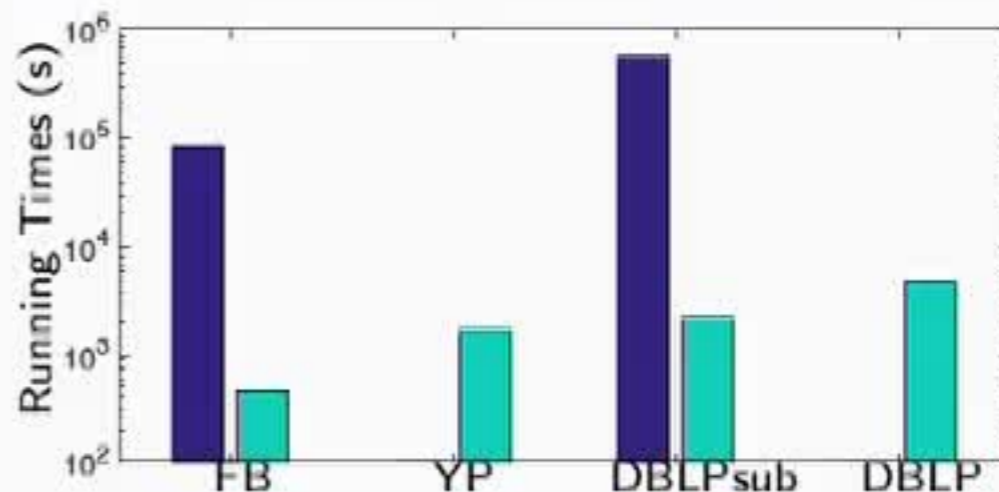

Tensor Methods Compared with Variational Inference

Learning Topics from PubMed on Spark: 8 million docs

Learning Communities from Graph Connectivity

Facebook: $n \sim 20k$ Yelp: $n \sim 40k$ DBLPsub: $n \sim 0.1m$ DBLP: $n \sim 1m$

Orders of Magnitude Faster & More Accurate

"Online Tensor Methods for Learning Latent Variable Models", F. Huang, U. Niranjan, M. Hakeem, A. Anandkumar, JMLR14.

"Tensor Methods on Apache Spark", F. Huang, A. Anandkumar, Oct. 2015.

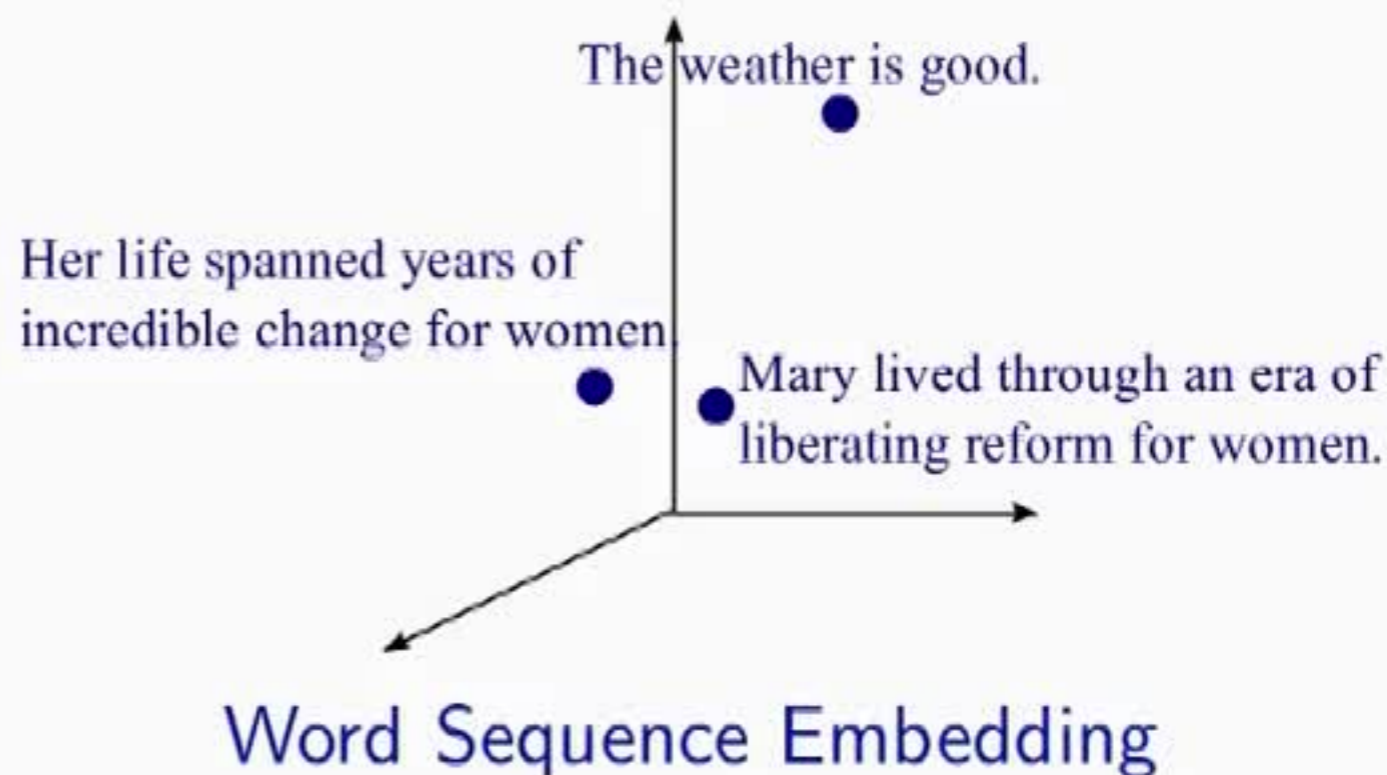

App 3: Cataloging Neuronal Cell Types In the Brain

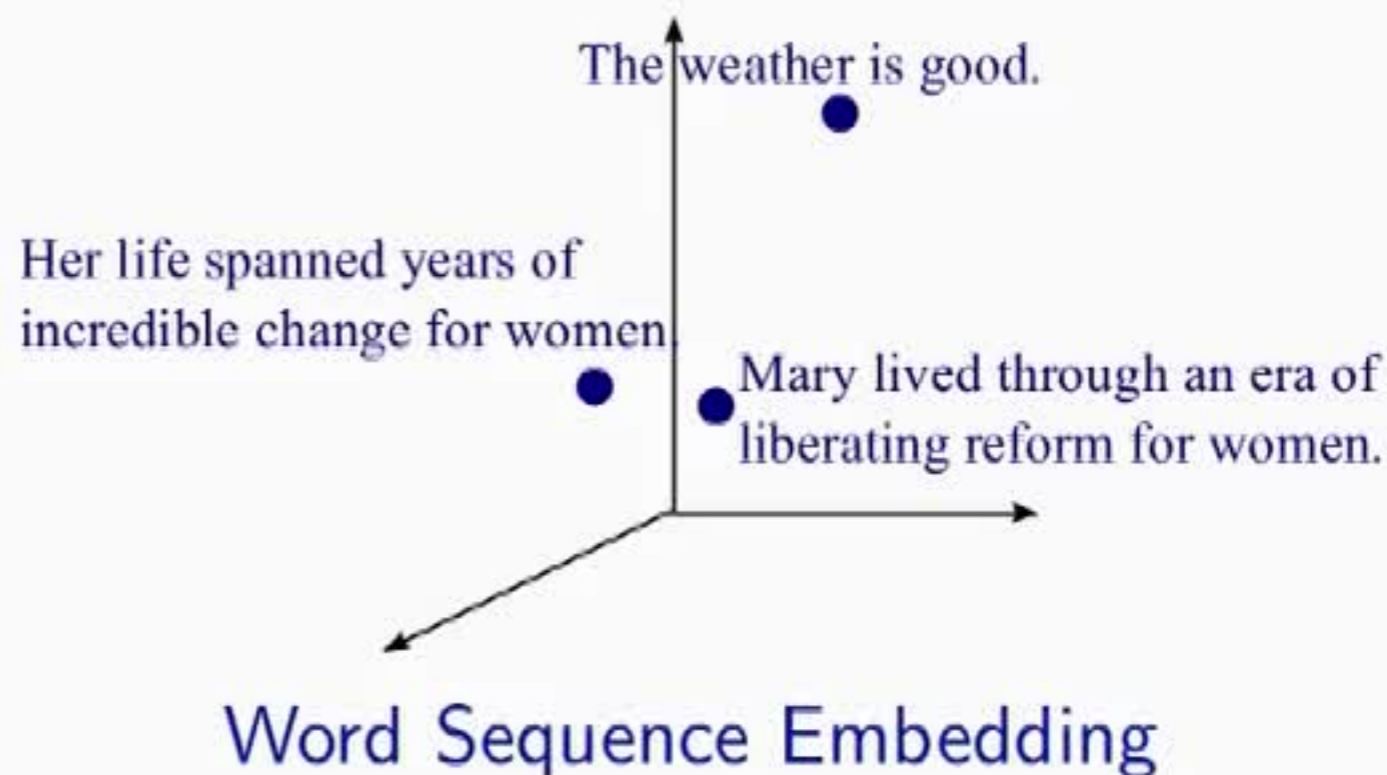

Neuroscience

- Observed: cellular-resolution brain slices
- Hidden: neuronal cell types

App 4: Word Sequence Embedding Extraction

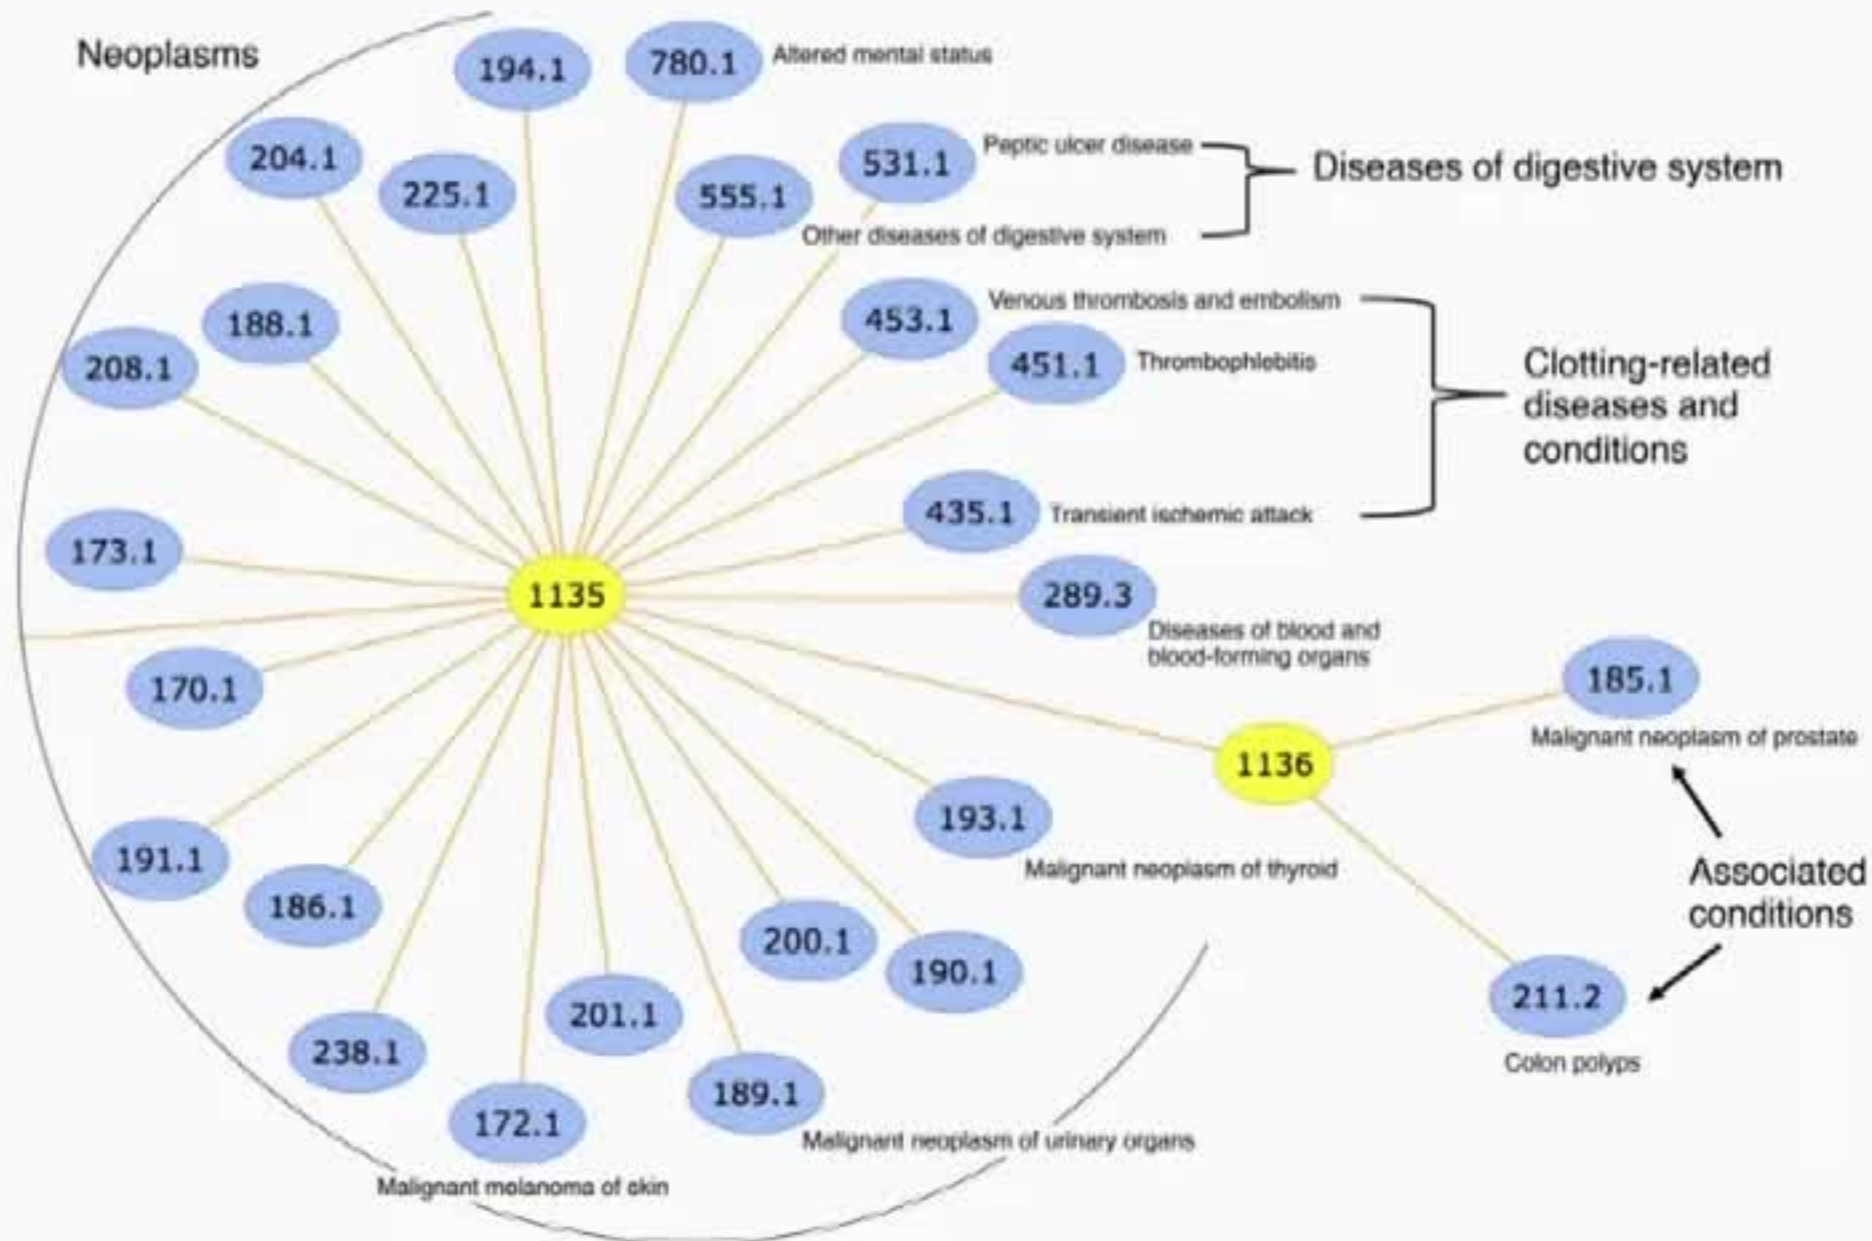

App 4: Word Sequence Embedding Extraction

App 5: Human Disease Hierarchy Discovery

CMS: 1.6 million patients, 168 million diagnostic events, 11 k diseases.

- **Observed:** co-occurrence of diseases on patients
- **Hidden:** disease similarity/hierarchy

" Scalable Latent TreeModel and its Application to Health Analytics " by F. Huang, N. U.Niranjan, I. Perros, R. Chen, J. Sun, A. Anandkumar, NIPS 2015 MLHC workshop.

Involve discovering the **hidden** and **compact** structure

that is embedded in the high-dimensional **complex observed data**

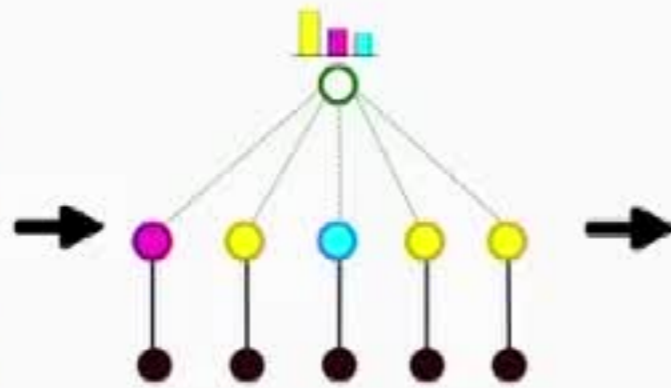

Challenges in Learning

Basic goal in all mentioned applications

Discover hidden structure in data: **unsupervised** learning.

Unlabeled data

Latent variable model

Learning Algorithm

Inference

Challenges in Learning

Basic goal in all mentioned applications

Discover hidden structure in data: **unsupervised** learning.

Unlabeled data

Latent variable model

Learning Algorithm

Inference

Challenges in Learning – find hidden structure in data

Challenge: Conditions for Identifiability

- Whether can model be identified given **infinite computation and data**?
- Are there **tractable algorithms** under identifiability?

Challenge: Efficient Learning of Latent Variable Models

- MCMC: **random sampling, slow**
Exponential mixing time
- Likelihood: **non-convex, not scalable**
Exponential critical points
- Efficient **computational** and **sample complexities**?

Guaranteed and efficient learning through spectral methods

Unsupervised Learning via Probabilistic Models

tensor decomposition → correct model

Contributions

- Guaranteed **online** algorithm with **global convergence** guarantee
- Highly **scalable**, highly **parallel**, dimensionality reduction
- Tensor library on **CPU/GPU/Spark**
- **Interdisciplinary** applications
- Extension to model with **group invariance**

Outline

- 1 Introduction
- 2 Introduction of Method of Moments and Tensor Notations**
- 3 LDA and Community Models
 - From Data Aggregates to Model Parameters
 - Guaranteed Online Algorithm
- 4 Conclusion

What is a tensor?

Multi-dimensional Array

- Tensor - Higher order matrix
- The number of dimensions is called tensor order.

Slices

- Horizontal slices

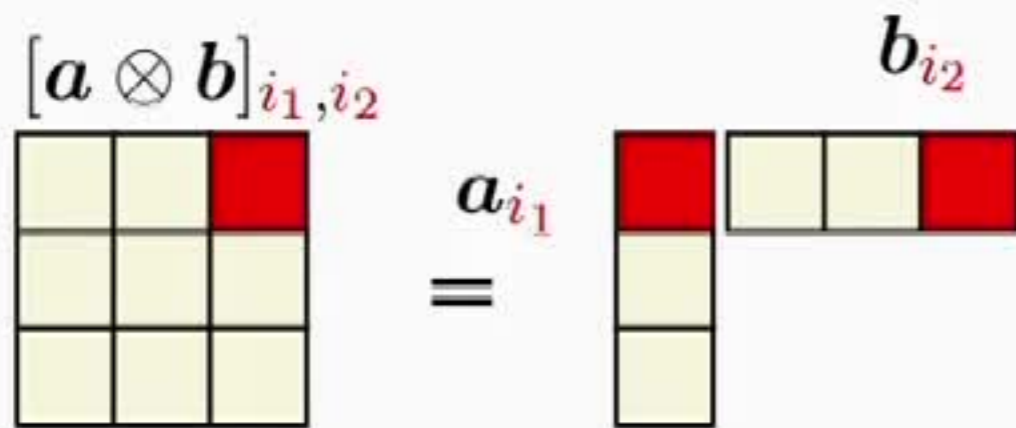

- Lateral slices

- Frontal slices

Tensor Product

- $[a \otimes b]_{i_1, i_2} = a_{i_1} b_{i_2}$
- Rank-1 matrix

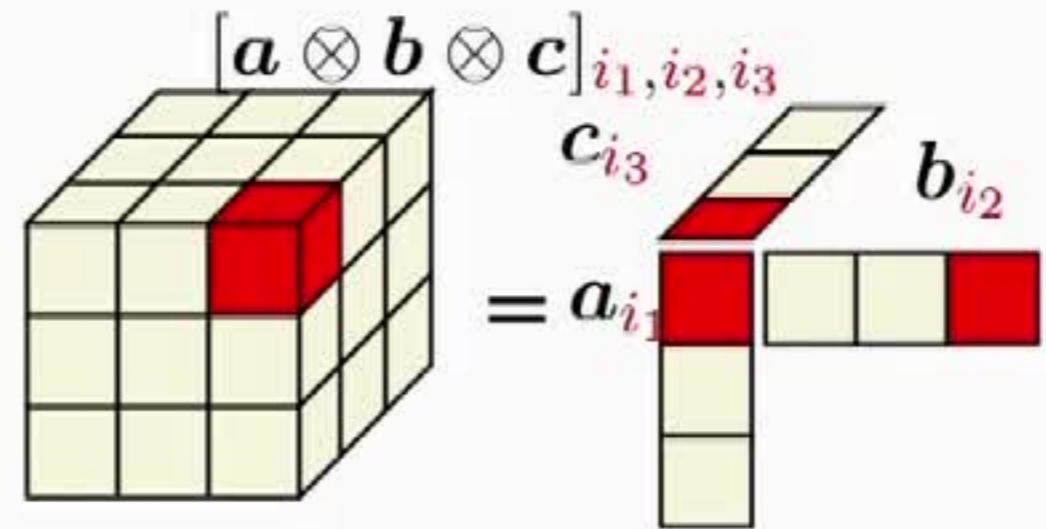

- $[a \otimes b \otimes c]_{i_1, i_2, i_3} = a_{i_1} b_{i_2} c_{i_3}$
- Rank-1 tensor

Tensor Product

- $[a \otimes b]_{i_1, i_2} = a_{i_1} b_{i_2}$
- Rank-1 matrix

- $[a \otimes b \otimes c]_{i_1, i_2, i_3} = a_{i_1} b_{i_2} c_{i_3}$
- Rank-1 tensor

Tensors in Method of Moments

Matrix: Pair-wise relationship

- Signal or data observed $\mathbf{x} \in \mathbb{R}^d$
- Rank 1 matrix: $[\mathbf{x} \otimes \mathbf{x}]_{i,j} = x_i x_j$
- Aggregated pair-wise relationship

$$\mathcal{M}_2 = \mathbb{E}[\mathbf{x} \otimes \mathbf{x}]$$

Tensor: Triple-wise relationship or higher

- Signal or data observed $\mathbf{x} \in \mathbb{R}^d$
- Rank 1 tensor:
 $[\mathbf{x} \otimes \mathbf{x} \otimes \mathbf{x}]_{i,j,k} = x_i x_j x_k$
- Aggregated triple-wise relationship

$$\mathcal{M}_3 = \mathbb{E}[\mathbf{x} \otimes \mathbf{x} \otimes \mathbf{x}] = \mathbb{E}[\mathbf{x} \otimes^3]$$

CP decomposition

- $\mathcal{X} = \sum_{h=1}^R \mathbf{a}_h \otimes \mathbf{b}_h \otimes \mathbf{c}_h$
- Summation of rank-1 tensors

Why are tensors powerful?

Matrix Orthogonal Decomposition

- **Not unique** without eigenvalue gap

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \mathbf{e}_1 \mathbf{e}_1^\top + \mathbf{e}_2 \mathbf{e}_2^\top = \mathbf{u}_1 \mathbf{u}_1^\top + \mathbf{u}_2 \mathbf{u}_2^\top$$

- **Unique** with eigenvalue gap

Why are tensors powerful?

Matrix Orthogonal Decomposition

- **Not unique** without eigenvalue gap

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \mathbf{e}_1 \mathbf{e}_1^T + \mathbf{e}_2 \mathbf{e}_2^T = \mathbf{u}_1 \mathbf{u}_1^T + \mathbf{u}_2 \mathbf{u}_2^T$$

- **Unique** with eigenvalue gap

Tensor Orthogonal Decomposition (Harshman, 1970)

- **Unique**: eigenvalue gap not needed

$Tensor = \mathbf{u}_1 \otimes \mathbf{u}_1 \otimes \mathbf{u}_1 + \mathbf{u}_2 \otimes \mathbf{u}_2 \otimes \mathbf{u}_2$

Why are tensors powerful?

Matrix Orthogonal Decomposition

- **Not unique** without eigenvalue gap

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \mathbf{e}_1 \mathbf{e}_1^T + \mathbf{e}_2 \mathbf{e}_2^T = \mathbf{u}_1 \mathbf{u}_1^T + \mathbf{u}_2 \mathbf{u}_2^T$$

- **Unique** with eigenvalue gap

Why are tensors powerful?

Probabilistic Topic Models - LDA

Bag of words

- Infer topics of documents
- Learn hidden process drives the obs.

Generative model

- Topic proportion $\sim \text{Dir}(\alpha)$ for a **doc**
- Draw a topic, then a word for a **token**

Goal

- Topic-word matrix $\mathbb{P}[\text{word} = e_i | \text{topic} = j]$

Moments Matching

Goal: Linearly independent topic-word table

$$\mathbb{E}[\text{word} | \text{topic} = j] = \sum_i \mathbb{P}[\text{word} = e_i | \text{topic} = j] e_i = \text{column } j$$

M_1 : Occurrence Frequency of Words

$$\mathbb{E}[\text{word}] = \sum_j \mathbb{E}[\text{word} | \text{topic} = j] \mathbb{P}[\text{topic} = j]$$

No unique decomposition of vectors

Moments Matching

Goal: Linearly independent topic-word table

$$\mathbb{E}[\text{word} | \text{topic} = j] = \sum_i \mathbb{P}[\text{word} = e_i | \text{topic} = j] e_i = \text{column } j$$

M_2 : Modified Co-occurrence Frequency of Word Pairs

$$\mathbb{E}[\text{word}_1 \otimes \text{word}_2] = \sum_{j, j'} \mathbb{E}[\text{word}_1 | \text{topic}_1 = j] \otimes \mathbb{E}[\text{word}_2 | \text{topic}_2 = j'] \mathbb{P}[\text{topic}_1 = j, \text{topic}_2 = j']$$

Matrix decomposition recovers subspace, not actual model

Moments Matching

Goal: Linearly independent topic-word table

Find a W

M_2 : Modified Co-occurrence Frequency of Word Pairs

$$\mathbb{E}[\text{word}_1 \otimes \text{word}_2] = \sum_{j, j'} \mathbb{E}[\text{word}_1 | \text{topic}_1 = j] \otimes \mathbb{E}[\text{word}_2 | \text{topic}_2 = j'] \mathbb{P}[\text{topic}_1 = j, \text{topic}_2 = j']$$

Many such W 's, find one, project data with W

Moments Matching

Goal: Linearly independent topic-word table

M_3 : Modified Co-occurrence Frequency of Word Triplets

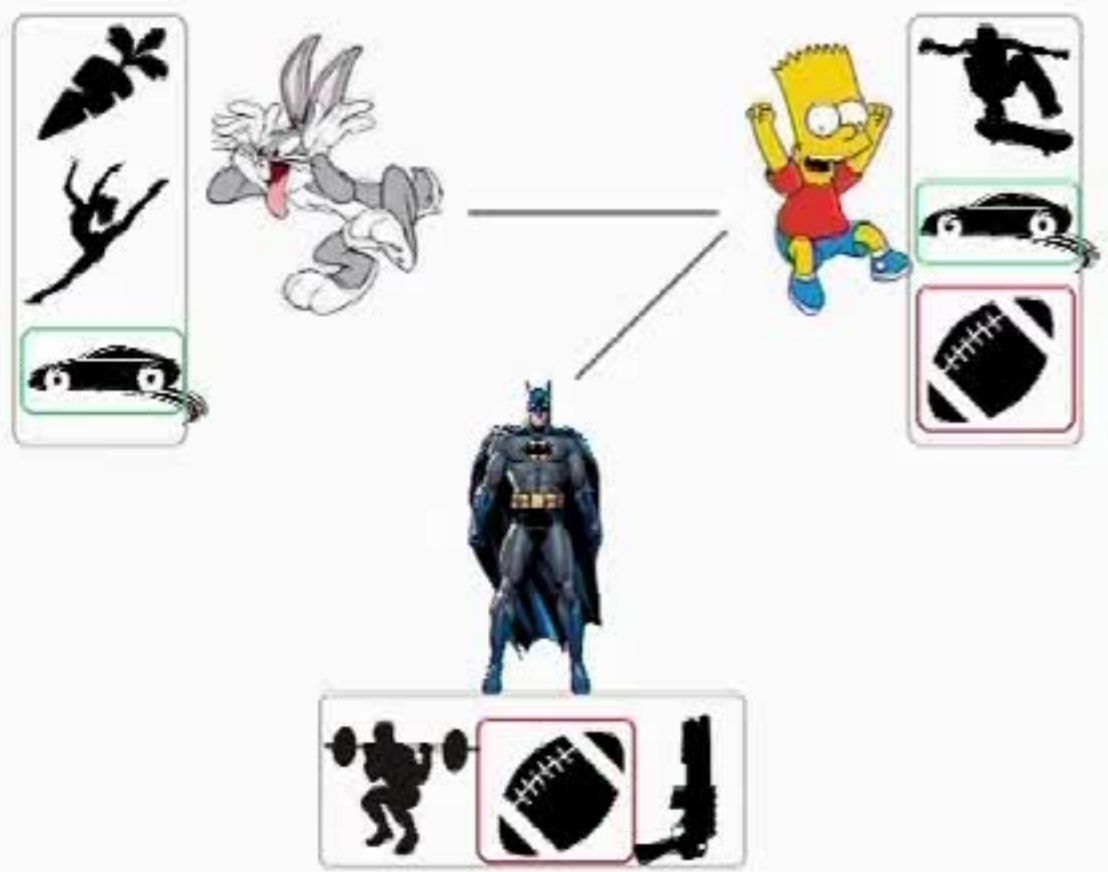

Tensor decomposition uniquely discovers the correct model

Learning Topic Models through Matrix/Tensor Decomposition

Mixed Membership Community Models

Mixed memberships

Moments Matching

Goal: Linearly independent topic-word table

M_3 : Modified Co-occurrence Frequency of Word Triplets

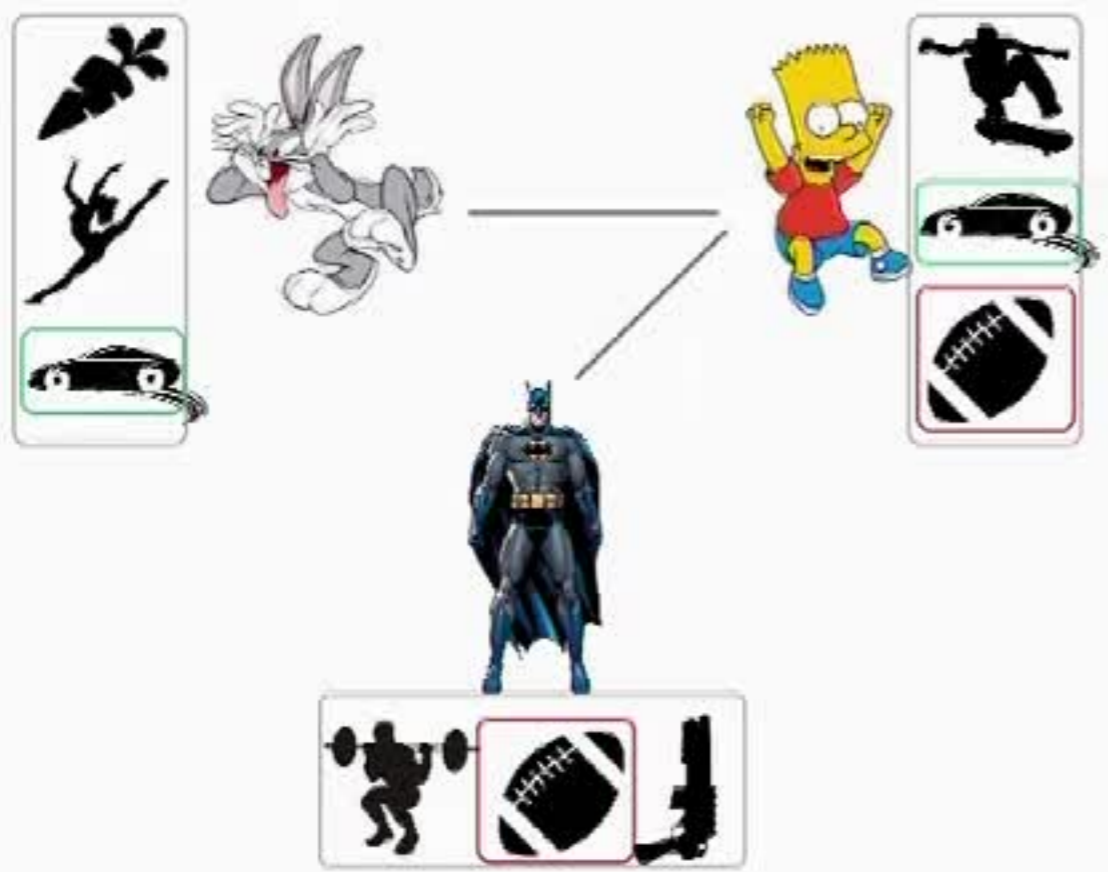

Tensor decomposition uniquely discovers the correct model

What ensures guaranteed learning?

Guaranteed Online Tensor Decomposition

Model is uniquely identifiable! How to identify?

Online Tensor Decomposition

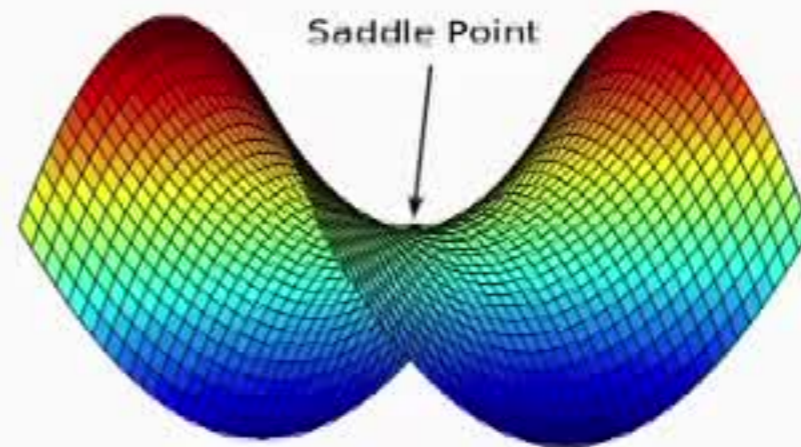

- Tensor $T = \sum_i a_i \otimes a_i \otimes a_i \otimes a_i$, where $\|a_i\| = 1, a_i^\top a_j = 0$

Objective?

- Objective $\min_{\forall i, \|u_i\|^2=1} \sum_{i \neq j} T(u_i, u_i, u_j, u_j)$ **Non-convex!**

Theorem: The proposed objective function has **equivalent local optima.**

Will SGD work?

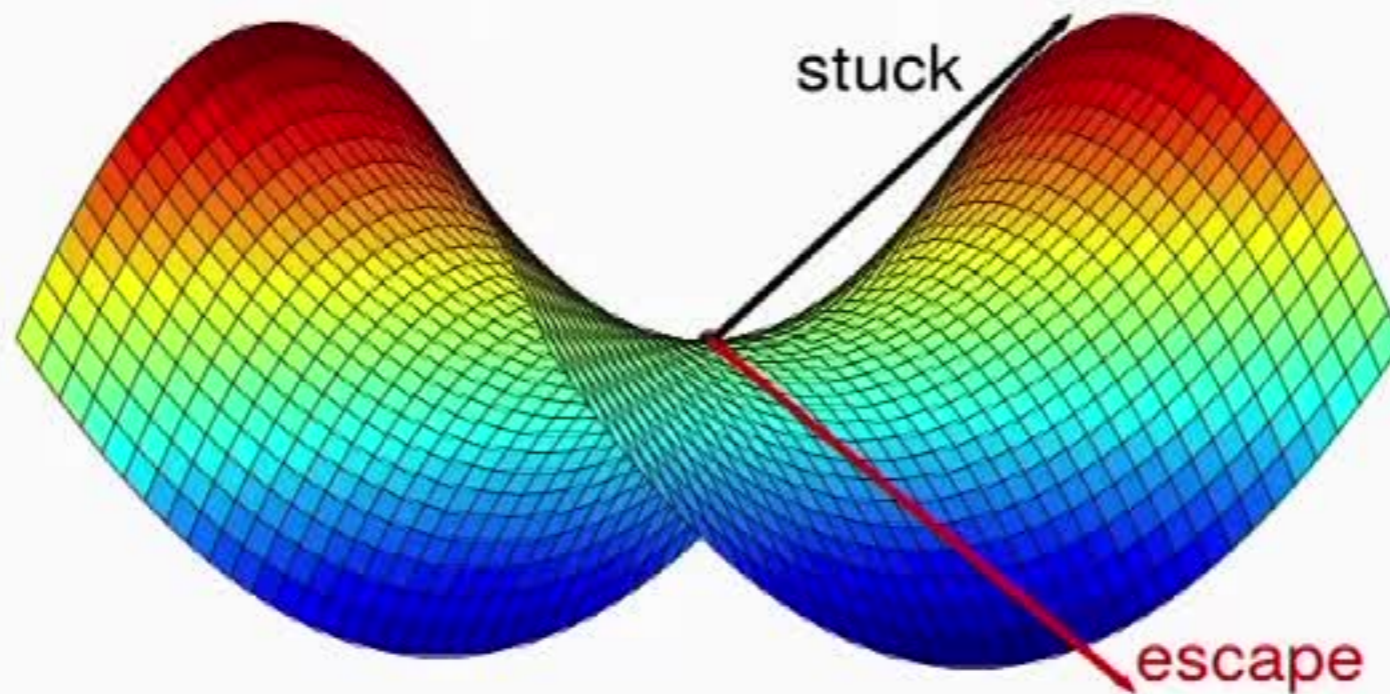

Theorem: For smooth, twice-diff fn. with non-degenerate saddle points, **noisy SGD** converges to a local optimum in polynomial steps.

Global Convergence Guarantee For Online Tensor Decomposition

Why could we escape from saddle points?

Stochastic Gradient Descent with Noise

- Saddle point has 0 gradient
- Non-degenerate saddle: Hessian has \pm eigenvalue
- Negative eigenvalue: direction of escape

Noise could help!
