

# A Modeling Approach to Assess the Feasibility of Water Injection, Storage, and Recovery

ASR Recoverability Guidance Project

# Reinaldo E. Alcalde Dr. Charles J. Werth

Environmental and Water Resource Engineering University of Texas at Austin

2019 Trade Fair Austin, TX

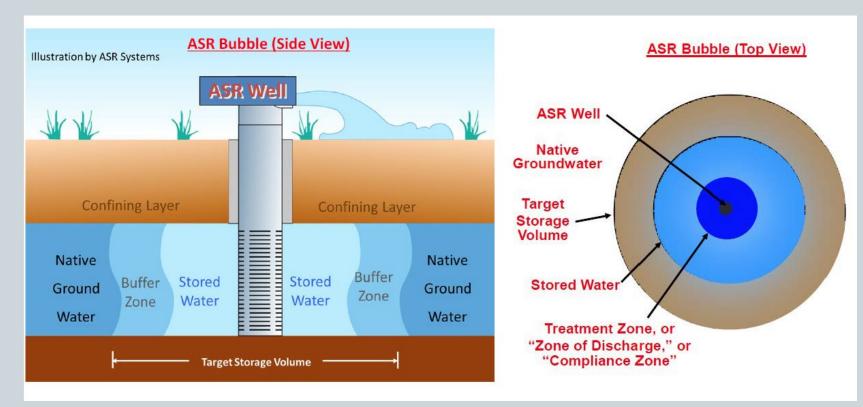

# Aquifer Storage and Recovery (ASR)

**ASR:** The injection of water into a geologic formation, group of formations, or part of a formation that is capable of underground storage of water *for later retrieval and beneficial use.* 

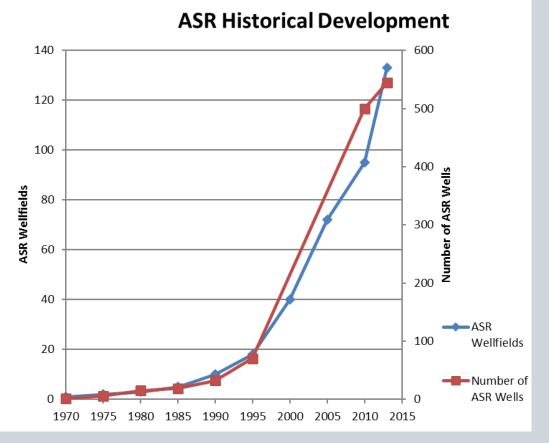

- TCEQ: 30TAC 331.2(8)

# **ASR Advantages**

- Little to no evaporative losses
- Minimized environmental disturbance and land consumption
- Low capital cost of implementation on a gallon-per-day capacity
- Versatile technology: Seasonal storage, long-term storage, emergency storage, diurnal storage
  - Bouwer, 2001, Khan et al., 2008, Maliva et al., 2006, Maliva and Missimer, 2010, National Research Council, 2008, Belser and Pyne et al., 2014, Smith et al., 2017

Belser and Pyne et al., 2014

# **TCEQ ASR Authorization Application**

## **Required Elements:**

- General Facility/Operator Information
- ASR Project Area
- Area of Review & Artificial Penetrations
- Well Construction & Closure
- Injection Well Operation
- Project Geology, Hydrogeology, and Geochemistry
- Demonstration of Recoverability

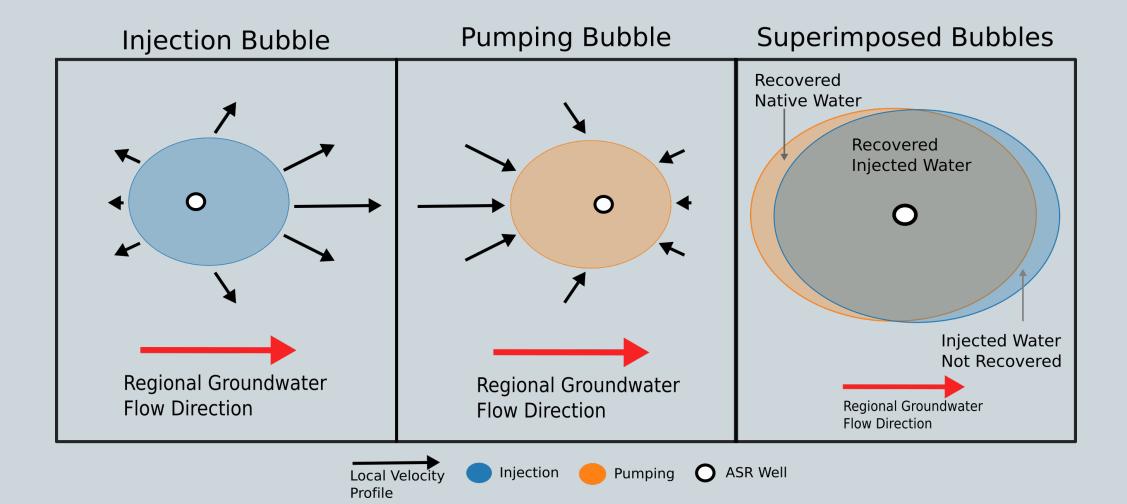

# **Project Objectives and Tasks**

**Objective:** Develop a **site specific** analytical tool for assessing the recoverability of injected waters in ASR operations

- **Task 1:** Identification of Data Needed (physical/operational parameters)
- Task 2: Identification of Modeling Approaches to Assess ASR
- Task 3: User Friendly Implementation of Modeling Approach

# **Schematic for Recovery**

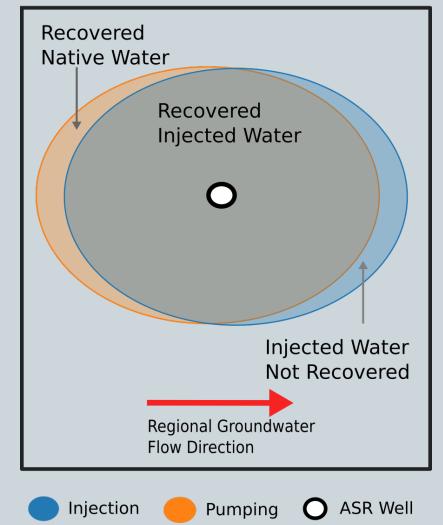

# Recovery Efficiency (RE):

$$RE = rac{V_r}{V_i} * 100\%$$
  
 $V_i = injected \ volume$   
 $V_p = pumped \ volume$   
 $V_r = recovered \ volume$ 

Example:  $Vi = 100 \ acre - feet$   $Vr = 80 \ acre - feet$   $Vp = 95 \ acre - feet$   $Recovery Efficiency = RE = \frac{V_r}{V_i} * 100\% = \frac{80}{100} * 100 = 80\%$ Lost Injected Fraction = 100% - RE = 20%

## Superimposed Bubbles

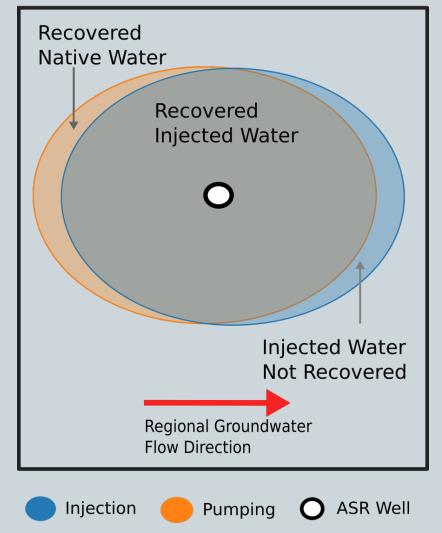

# Native Fraction (NF):

$$NF = rac{Vp - Vr}{Vp} * 100\%$$
  
 $V_i = injected \ volume$   
 $V_p = pumped \ volume$   
 $V_r = recovered \ volume$ 

Example:  

$$Vi = 100 \ acre - feet$$
  
 $Vr = 80 \ acre - feet$   
 $Vp = 95 \ acre - feet$   
Percent Native Fraction  $= \frac{Vp - Vr}{Vp} * 100 = \frac{(95 - 80)}{95} * 100 = 15.8\%$ 

## Superimposed Bubbles

# General Approach: Groundwater Models

**Groundwater Models:** Computational mathematical approximations describing groundwater flow and transport

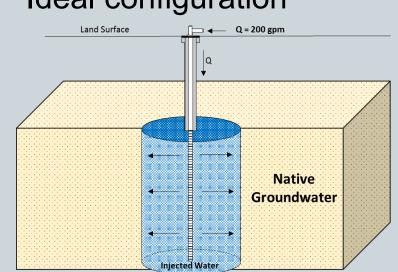

- Analytical Model
  - Equations have exact solution
  - Solution limited by assumptions made
  - Opportunity for misuse is low
- Numerical Model
  - Equations approximate exact solution
  - Adaptable for complex groundwater flow systems
  - Computationally taxing
  - Opportunity for misuse is high

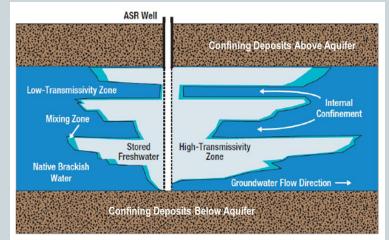

# **Our Approach:** 2-D Analytical Model for Simulating ASR Recoverability

- Obtained by superposition of the complex potentials of uniform flow (derived from hydraulic head and streamlines) Bear and Jacob (1965)
- Determines recoverability for single ASR well
   under steady flow conditions
- Assumptions:
  - Confined aquifer with infinite plane
  - Homogenous aquifer hydraulic properties
  - Constant pumping and injection rates
  - Storativity neglected
  - Mixing and dispersion neglected

See documentation for more details

## **Complex configuration**

(modified from Maliva et al., 2006).

## Ideal configuration

# User Friendly Model Implementation ASR App

- Simple way for applicants to initiate assessment of water injection, storage, and recovery
- Interactive features for conceptual understating
- Built with **Dash**: A Python framework for building web-based applications
- **Python**: Open-sourced programming language

### Aquifer Storage and Recovery (ASR) Applet

The ASR app provides a simple way to assess the feasibility of water injection, storage and recovery.

### Aquifer Storage and Recovery (ASR) Applet

The ASR app provides a simple way to assess the feasibility of water injection, storage and recovery.

#### **Operational Parameters:**

Interactive Graphical Output:

- Recovery Efficiency vs Pumping Time for multiple injection times
- Critical RE where Vi=Vp is displayed

## Interactive Graphical Output:

- Allows for viewing front or bubble position for any and all RE values
- Native fraction pumped is displayed

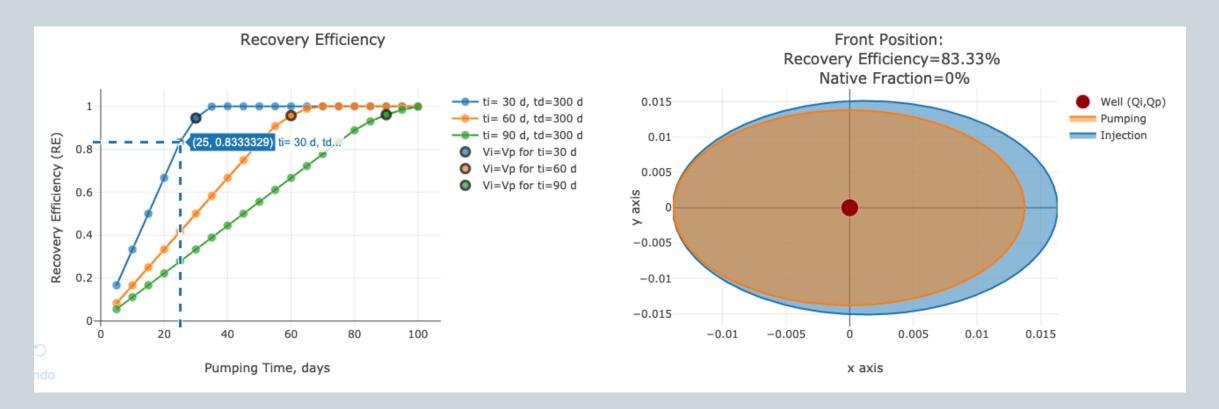

## Selected RE: Vp<Vi

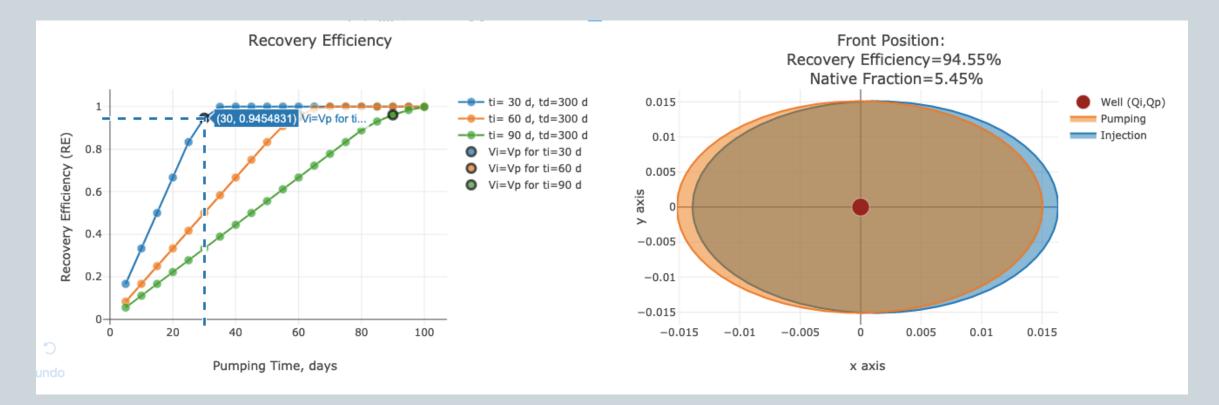

- Recovers 83.3% of injected water
- Captures 0% native water

## Selected RE: Vi = Vp

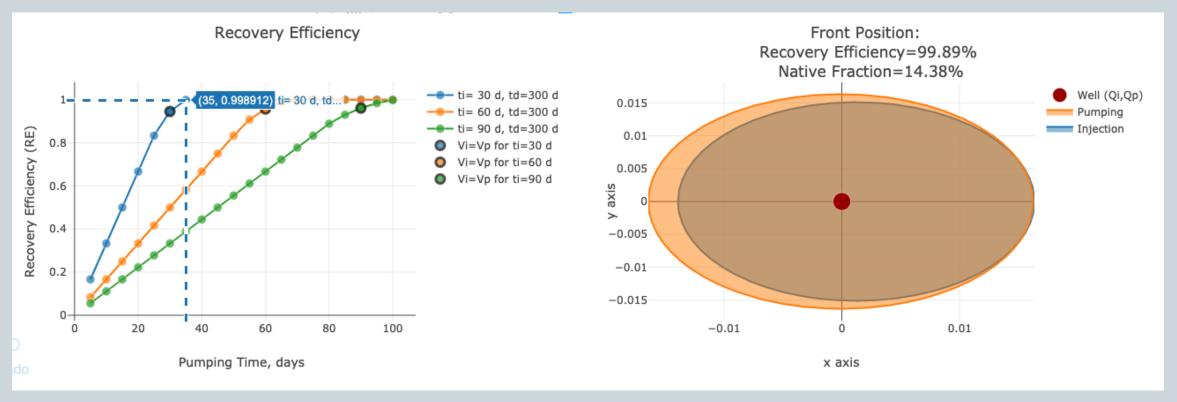

- Recovers 94.6% of injected water
- Captures 5.5% native water

## Selected RE: Vp > Vi

- Exceeds injected volume
- Recovers 99.9% of injected water
- Captures 14.4% native water

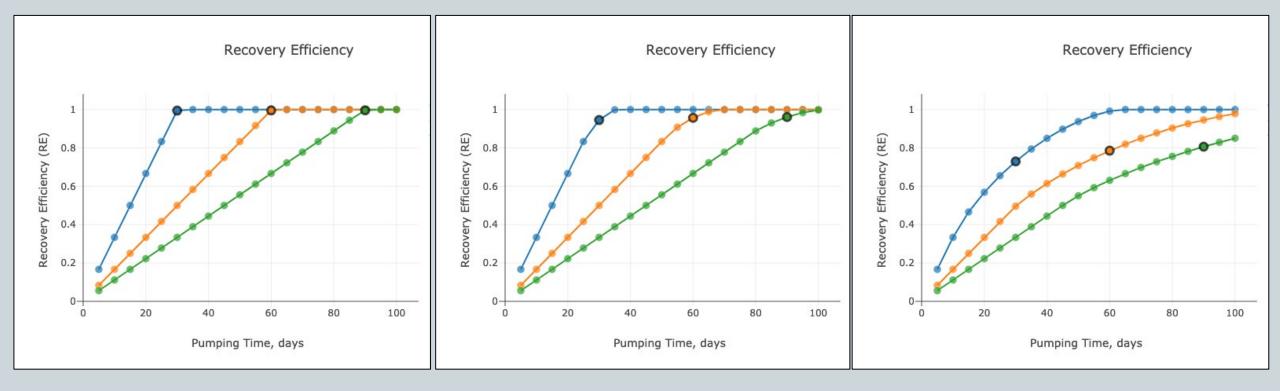

## Hydraulic Gradient (dh/dx) effects

dh/dx= 0.0001 (Low)

dh/dx = 0.001 (Mid)

# Model Comparison: Numerical (MODFLOW) vs Analytical (ASR APP)

# Concluding remarks...

We identified and developed a user friendly application for assessing site specific recoverability of injected waters in ASR operations.

- Coded an analytical model though Python
- Developed a web-based app through Dash
- Compared our analytical solution with numerical models (MODFLOW)
- Addressed some limitations

The ASR app is an initial assessment, complex aquifer systems may require additional complex numerical modelling to justify recoverability.

# Continued work...

- Deployment of ASR App to UT web-server for public use
- Case study documentation for our final deliverable
